MODERN PAINTERS

VOLUME V

COMPLETING THE WORK, AND CONTAINING

PARTS

VI. OF LEAF BEAUTY—VII. OF CLOUD BEAUTY

VIII. OF IDEAS OF RELATION

I. OF INVENTION FORMAL

IX. OF IDEAS OF RELATION

2. OF INVENTION SPIRITUAL

BY

JOHN RUSKIN

*"Accuse me not
Of arrogance,
If, having walked with Nature,
And offered, far as frailty would allow,
My heart a daily sacrifice to Truth,
I now affirm of Nature and of Truth,
Whom I have served, that their Divinity
Revolts, offended at the ways of men,
Philosophers, who, though the human soul
Be of a thousand faculties composed,
And twice ten thousand interests, do yet prize
This soul, and the transcendent universe,
No more than as a mirror that reflects
To proud Self-love her own intelligence."*

WORDSWORTH

LONDON

GEORGE ALLEN, 156, CHARING CROSS ROAD

NEW YORK: LONGMANS, GREEN, AND CO.

1905

CONTENTS OF VOLUME VII

LIST OF ILLUSTRATIONS	PAGE xiii
INTRODUCTION TO THIS VOLUME	xix
BIBLIOGRAPHICAL NOTE	lxxi
<i>Modern Painters</i> , VOL. V. (CONTAINING THE TEXT OF ALL THE EDITIONS):---	

PREFACE	3
-------------------	---

PART VI. "OF LEAF BEAUTY":—

CHAP.	
I. THE EARTH-VEIL	15
II. THE LEAF-ORDERS	20
III. THE BUD	24
IV. THE LEAF	36
V. LEAF ASPECTS	51
VI. THE BRANCH	58
VII. THE STEM	69
VIII. THE LEAF MONUMENTS	85
IX. THE LEAF SHADOWS	101
X. LEAVES MOTIONLESS	115

PART VII. "OF CLOUD BEAUTY":—

I. THE CLOUD-BALANCINGS	133
II. THE CLOUD-FLOCKS	144
III. THE CLOUD-CHARIOTS	162
IV. THE ANGEL OF THE SEA	175

CONTENTS

PART VIII. "OF IDEAS OF RELATION :—FIRST, OF INVENTION FORMAL" :—

CHAP.	PAGE
I. THE LAW OF HELP	203
II. THE TASK OF THE LEAST	217
III. THE RULE OF THE GREATEST.	230

FACSIMILES

A PAGE OF THE MS. OF "MODERN PAINTERS," VOL. V. (Pt. ix.

Ch. ix. § 1) *Between pages* 374, 375

A PAGE OF THE MS. OF "MODERN PAINTERS," VOL. V. (Pt. ix.

Ch. xii. §§ 19, 20) *Between pages* 458, 459

Note.—The Frontispiece and Plates—Nos. 55, 70, 72, 76, and 82—are printed from the original steels; Nos. 68 and 80 from the steels engraved by G. Cook for the new edition of 1888. Two of the Plates—56 and 64—are line blocks, reduced from early impressions of the originals. The other Plates are photo-gravures from early impressions of the originals. Three of them—73, 74, and 86—are the size of the originals; the others are reduced (by about one-fourth) in order to fit the page. The three last Plates—85, 86, 87—were first added in the edition of 1888.

Of the Plates added in this edition, A has previously appeared in *Scribner's Magazine*, December 1898, and the *Magazine of Art*, April 1900; and B in the *Studio*, March 15, 1900.

Several of the drawings from which the Plates were engraved have been exhibited at the Coniston Exhibition, 1900; the Ruskin Exhibition at the Royal Society of Painters in Water-Colours, 1901; and the Ruskin Exhibition at Manchester, 1904. No. 53 (a water-colour, the same size as the original Plate) was at Manchester No. 64. No. 55 (pen and brush, again the same size) was at Coniston No. 132, and at the Society of Painters in Water-Colours, No. 221. No. 68 was at the Society of Painters in Water-Colours No. 218 (the same size, but the sky was altered in engraving). No. 76 was, at the Society also, No. 45 (pen and ink, $12\frac{1}{4} \times 16$). The drawing of Plate A was at the Society of Painters in Water-Colours No. 363, and at Manchester, No. 231. That of Plate B was No. 304 at the Royal Water-Colour Society, and No. 361 at Manchester; that of Plate C was No. 154 at the Royal Water-Colour Society; and that of Plate F was No. 353 at the Royal Water-Colour Society, and No. 129 at Manchester.

INTRODUCTION TO VOL. VII

(In the chronological order Vol. VI. is followed in succession by Vols. XIII., XIV., XV., and XVI.; the present Introduction should thus be read after that to Vol. XVI.)

THE third and fourth volumes of *Modern Painters* were published in January and April 1856; the fifth, and concluding, volume did not appear till June 1860. The causes which led to this delay are glanced at by Ruskin in his Preface to the fifth volume, and they have been more fully described in the Introductions to Volumes XIII. XVI. The years which intervened were four of the busiest in Ruskin's busy life, and the tasks which occupied him seemed more important at the moment than the completion of his book. He was hard at work, then, on other things; but also he had much to learn before he could see his way to bring his long argument to a conclusion. The book, which began as an essay in defence of a particular painter, had branched forth in many directions, with something of "the Dryad's waywardness"; and though firmly rooted all the while in strong and definite principles, yet his opinions on particular schools and masters were growing, now in this direction, and now in that, while new subjects of inquiry opened out on every side.

The manifold activities which we have traced in Volumes XIII.–XVI. were pursued in the busy world of men; Ruskin was arranging drawings in the National Gallery, criticising the picture exhibitions, teaching drawing, and lecturing in the great manufacturing towns. The completion of *Modern Painters* required a different kind of experience—

"The silence that is in the starry sky,
The sleep that is among the lonely hills."

Those other lines from Wordsworth which Ruskin took as his motto in the first volume of *Modern Painters*, and which he reprinted on the title-page of each succeeding volume, were the expression not only of the spirit in which the author undertook his task but of a biographical fact. At each stage in his work *Modern Painters* was the result of his

"having walked with Nature" and "offered his heart a daily sacrifice to Truth." It was in the Fairies' Hollow at Chamouni or among the shade of the Unterwalden pine; in the solitude of the Scottish moors; in the sacred places of Swiss history; or from his study windows, open to the stars and clouds, that Ruskin carried on the studies of natural beauty, and conceived the imaginative fancies and piercing thoughts, which he was afterwards to clothe with literary art. Foreign travel, too, always stimulated his powers. "It is good for me," he wrote to his father from Turin (July 19, 1858), "to be on the Continent, as I get a sensation every now and then—and knowledge always: in England I can enjoy myself in a quiet way as I can in the garden at home, but I get no strong feeling of any kind." This Introduction, therefore, will be mainly concerned with his summer tours in 1856, 1857, 1858, and 1859. It is characteristic of Ruskin's strenuous life that the crowning volume of his principal work should be the fruit of holiday tasks and holiday thoughts.

1856

We left Ruskin in an earlier Introduction¹ as he was about to start in May 1856 for a tour with his parents in Switzerland. He had been through a hard spell of winter's work in finishing the third and fourth volumes of *Modern Painters*; he must have needed the holiday, and he was in the mood to enjoy it.² The diary shows him in full activity and enthusiasm. At Calais—now how much changed from then!—he finds "for once nothing changed anywhere: the young leaves lovely, and the old spire seen through them." At Senlis, the view from the cathedral is "quite magnificent, and the clear, crystalline French sunlight like Paradise." At Nancy he finds the town

"much more beautifully placed than I supposed. The limestone hills above it, with many springs at their feet, rising three or four hundred feet pretty steeply to the higher plains, and wild and broken at the

¹ Vol. XIII. p. xxxi.

² The itinerary of this tour was as follows: Dover (May 14), Calais (May 15), by Lille to Amiens (Hôtel de France, May 17), by Creil to Senlis (May 19), Meaux (May 20), Rheims (May 21), Nancy (May 23), Strasburg (May 24), Bâle (May 30), Montreux (June 4), Berne (June 5), Thun (June 7), Interlachen (June 10), Lauterbrunnen (June 24), Thun (June 26), Berne (July 8), Fribourg (July 9), Vevay (July 15), Geneva (July 21), St. Martin (July 25), Chamouni (July 26), St. Martin (August 19), Geneva (August 20), Fribourg (August 22), Bulle (September 3), Geneva (September 4), St. Laurent (September 8), Dijon (September 10), Fontainebleau (September 12), Paris (September 13), Amiens (September 23), Arras (September 24), Calais (September 25), Dover (September 27), Denmark Hill (October 1). Couttet accompanied Ruskin and his parents, meeting them at Calais.

tops, richly clothed with the finest flowers of the *Polygala Alpina* I ever saw, mixed with columbine (lilac-coloured), both in full flower on May 23rd. I walked with Couttet up the sloping path, and saw the hills of the Vosges, far higher than I expected, and looking lovely, the air exquisitely delightful, soft, and pure. Recollect general principle of Furniture colour, brought out by my pretty little bedroom at Nancy, that a pale bluish green ground, with rose, purple, and scarlet flowers on it, and dark wood for woodwork, is as pleasant to the eye—soothing and rich—as it is possible to have it. Nothing could be more delightful than the little room, with its golden green of fresh leafage outside, and breeze through window and fresh green within.”

The travellers went by their old road to Bâle, and spent seven or eight weeks in the towns or on the lakes of Northern Switzerland, in the Bernese Oberland, and at Fribourg. One of the main objects which Ruskin proposed to himself on this tour was a continuation of the intended series of illustrations of Swiss towns, to which we have already referred.¹ The illustrations were to accompany a book on Swiss history, and the diary contains various memoranda of dates and events; to which, in after years, Ruskin added the comment, “Things begun, unfinished: No. 1—Swiss Battles.” The list was destined to become a long one; for Ruskin was for ever planning more schemes than even his prodigious industry and unafrighted plunges into new subjects could possibly complete. “My father,” he writes of this tour,² “begins to tire of the proposed work on Swiss towns, and to inquire whether the rest of *Modern Painters* will ever be done.” Perhaps he had tired of the historical project a little himself; at any rate, the snows of Chamouni began to call, and in the middle of July the party moved to Vevay, Geneva, St. Martin, and Chamouni. Arrived among the Aiguilles, Ruskin was soon deep in his geological studies: “at work with pickaxe and spade before breakfast,” we read more than once in the diary, “for an hour and a half.” He paid another flying visit to Chamouni in 1858, and was there again for a few days in 1859; but this, in 1856, was the longest of the visits which immediately preceded the fifth volume of *Modern Painters*. He visited all his favourite haunts—the Fairies’ Hollow at Châtelard, the Breven, and the rest; he was very busy with his sketch-book, and noted, as well as drew, the movements of the clouds among the mountains. At Chamouni Ruskin met his friend

¹ Vol. V. p. xxxii.

² *Præterita*, ii. ch. i. § 11.

Layard,¹ and heard from him, no doubt, the story of his researches among the decaying frescoes of Italy.

It was on this occasion also that Ruskin made one of his most valued friendships. In the autumn of 1855 Professor Charles Eliot Norton had presented an introduction to Ruskin and been shown the Turners at Denmark Hill. In the following summer he was in Switzerland with his mother and sisters, and the two parties happened to meet on the Lake of Geneva; they arranged to meet again at St. Martin, "and thus," says Ruskin, "I became possessed of my second friend, after Dr. John Brown, and of my first real tutor, Charles Eliot Norton."² Ruskin in the same place has given an impression of Professor Norton and expressed his obligations to his friend. Here is Professor Norton's picture of Ruskin, as he showed himself at this time:—

"His abundant light-brown hair, his blue eyes, and his fresh complexion gave him a young look for his age [37]; he was a little above middle height, his figure was slight, his movements were quick and alert, and his whole air and manner had a definite and attractive individuality. There was nothing in him of the common English reserve and stiffness, and no self-consciousness or sign of consideration of himself as a man of distinction, but rather, on the contrary, a seeming self-forgetfulness and an almost feminine sensitiveness and readiness of sympathy. His features were irregular, but the lack of beauty in his countenance was made up for by the kindness of his look, and the expressiveness of his full and mobile lips. . . . The tone of dogmatism and of arbitrary assertion too often manifest in his writing was entirely absent from his talk. In spite of all that he had gone through of suffering, in spite of the burden of his thought, and the weight of his renown, he had often an almost boyish gaiety of spirit and liveliness of humour, and always a quick interest in whatever might be the subject of the moment. He never quarrelled with a difference of opinion, and was apt to attribute only too much value to a judgment that did not coincide with his own. I have not a memory of these days in which I recall him except as one of the pleasantest, gentlest, kindest, and most interesting of men."³

Among the immediate benefits which Professor Norton conferred on Ruskin was an introduction to the works of Lowell. He "must be a

¹ "At Chamouni," writes Layard (August 12, 1856), "I fell in with Ruskin, and enjoyed a walk with him on the glaciers; he is always eloquent and agreeable" (*Autobiography*, vol. ii. p. 209). In the autumn of 1855, and again in that of 1856, Layard made the tours which he described to the Arundel Society in 1857: see Vol. XVI. p. 448; and compare *ibid.*, p. 76 n.

² *Præterita*, iii. ch. ii. § 46.

³ *Atlantic Monthly*, May 1904, vol. 93, pp. 577, 581; republished (with slight alterations) in *Letters of John Ruskin to Charles Eliot Norton*, Boston, 1904, vol. i. p. 5.

noble fellow," wrote Ruskin, who in this volume (below, p. 451) refers to the poet as his dear teacher.

"He seemed to me," adds Professor Norton, "cheerful rather than happy. The deepest currents of his life ran out of sight." There was, for one thing, no longer that complete inward unity which is necessary to happiness; Ruskin was beginning, as we have seen, to outgrow the simple and assured religious faith of his childhood and early manhood. Then, again, more and more, as the years went by, he was to be oppressed by the contrast between the beauty of the world of nature and the hardness of the human lot, the blindness, the indifference, or the folly of mankind towards the things which pertain to their peace. The responsibilities of human life, the shortness of the allotted span, as measured by the infinity of things to be learnt and to be done, weighed heavily upon a man whose curiosity was as unbounded as his versatility. There is a Sunday meditation in his diary of this period (Geneva, September 7, 1856) which reveals some of the inner currents of Ruskin's life. He makes a numerical "calculation of the number of days which under perfect term of human life I might have to live." He works the sum out to 11,795, and for some years onward the days in his diary are noted by the diminishing numbers.¹ They who most redeem the time are often most conscious that they are but unprofitable servants. Ruskin acted more than most men on the proverb *Nulla dies sine linea*; but entries such as this—"11,793. Nothing much learned to-day"²—are not infrequent in his diary. Throughout this tour of 1856 he was, however, constantly at work, not only drawing, observing, geologising, but also, in accordance with his invariable custom, reading; and by reading Ruskin meant reading, marking, learning. The diary of this summer shows him busy, among other things, with notes on the morality of *Redgauntlet*, and with an analysis and collation of all the texts in the Bible relating to Conduct and Faith. In the evenings he read aloud to his mother, selecting on this occasion several of George Sand's stories; on these also he made critical notes.

There were times when Ruskin found among the mountains the mood which is described by Wordsworth:—

"That blessed mood,
In which the burthen of the mystery,

¹ With some interruptions from ill-health, the "perfect term of human life" was allotted to Ruskin; he was 70 in 1889, which was in fact the end of his working years.

² The same remark occurs in his diary of March 31, 1840. He had then begun to keep a diary in which to jot down what he learnt each day.

In which the heavy and the weary weight
 Of all this unintelligible world,
 Is lightened :—that serene and blessed mood,
 In which the affections gently lead us on,—
 Until, the breath of this corporeal frame
 And even the motion of our human blood
 Almost suspended, we are laid asleep
 In body, and become a living soul :
 While with an eye made quiet by the power
 Of harmony, and the deep power of joy,
 We see into the life of things.”

This feeling was frequent with Ruskin, and it inspired many a page in *Modern Painters* ; but it was not constant. The very exquisiteness of his sensibility may have fatigued him, and made him impatient for change. Two extracts from the same page in his diary reflect the changes of mood :—

“Sept. 9.—The air at St. Laurent this morning was so soft that it seemed to have passed through warm eiderdown or been breathed by angels before it was sent down to us. The shingle-covered houses, of quaint, yet rude shapes, have a strange grey-hooded, half monkish, half wood-pigeon-like modesty of rural wildness about them, quite different from the pretentious cottages of Berne.”

“September 11, DIJON.—I cannot understand why in a sunny walk through these streets and a suburb more like a village in the neighbourhood of Oxford than a French one, I should have had more pleasure this afternoon than in my walks about Fribourg, or in Chamouni. (Perhaps as one gets older human nature interests one more ; perhaps there are very happy associations connected with this place ; perhaps the mere change may be pleasant, I having never stopped long enough in these French towns to get tired of them, and the human nature here is much more piquant and varied, and, in most cases, pleasing in aspect, than cottage life.) But so it was : I certainly would not have changed the streets for any mountain glen.”

1857

From Dijon Ruskin returned to Paris, where he again spent several days in studying the pictures at the Louvre.¹ He was home early in October, and plunged at once into some of that various work which is described in other volumes. Turner's pictures and drawings had

¹ Compare Vol. XII. pp. 448–473.

now come into the possession of the nation. Ruskin examined them and wrote to the *Times* offering to arrange the drawings (Vol. XIII. pp. xxxii., 81–85). The pictures were soon exhibited at Marlborough House: Ruskin wrote a catalogue of them (*ibid.*, pp. xxxiii., 89–181). In order to show how he proposed to arrange the drawings, he wrote a catalogue of One Hundred of them (*ibid.*, pp. xxxiii., 183–226). His classes at the Working Men's College simultaneously claimed his attention; and, as an off-shoot, from this work, he wrote during the winter of 1856–1857 *The Elements of Drawing* (Vol. XV.). At the beginning of the new year he was further engaged in lecturing (see Vol. XVI. p. xviii.). A sufficiently busy time, it will be seen; yet he always found leisure both to see his friends and to write to them—as will sufficiently appear from the letters of this period collected in a later volume. The spring and summer of 1857 brought fresh tasks. There were his *Academy Notes* to be written (Vol. XIV.); and in July the Manchester lectures on *The Political Economy of Art* were delivered (Vol. XVI.).

Ruskin may well have needed a holiday by this time, and—after a visit to Sir Walter and Lady Trevelyan at Wallington—he was taken off by his parents to the Highlands (July to October). Of this tour no diary has been found. The short sketch which Ruskin gives of it in his autobiography¹ suggests that he was not too well pleased at being diverted from his favourite haunts among the Alps. But the journey left vivid impressions upon his mind, and was fruitful, both in minute studies of nature and in general observations. The opening pages of *The Two Paths* are eloquent with Ruskin's impressions of a country “stern and wild,” which is devoid of any “valuable monuments of art,” while yet it is the nurse of noble heroism, and is able to “hallow the passions and confirm the principles” of its children “by direct association with the charm, or power, of nature.”² In the present volume, too, there is a passage which records an impression of the same tour.³ Ruskin worked hard during the autumn at drawing. A single drawing at Blair Athol took him, he says, “a week at six hours a day.”⁴ He was here on Turner's ground, and, many years later, in one of his Oxford lectures, when he was discussing the plate of Blair

¹ *Præterita*, iii. ch. i. § 11. Ruskin was at Wallington on July 15; Blair Athol, August 22; Edinburgh and Dunbar, September 14; Penrith, September 25–27. These are the dates on published letters. He went as far north as the Bay of Cromarty (*Præterita*).

² Vol. XVI. pp. 259–261. See also *ibid.*, p. 190.

³ Part ix. ch. ii. § 11 (below, p. 268).

⁴ Vol. XVI. p. xxxviii. The drawing is perhaps one of those in Professor Norton's collection.

Athol in *Liber Studiorum*, his memory went back to every detail of the scene, as he had observed and sketched it in 1857.¹ In the same lecture he noticed others of Turner's Scottish subjects which he himself had examined on the spot.² The drawing here reproduced of a foreground scene at Killiecrankie belongs to the same visit, and will serve to show the minuteness of Ruskin's work; in which respect it should be compared with the similar study at Glenfinlas, made four years earlier.³

Ruskin hurried back from Scotland on receiving official intimation that the Trustees of the National Gallery had decided to entrust the arrangement of the Turner drawings to him.⁴ This was his main work during the ensuing months, and it was very heavy (Vol. XIII.). But he also revised for publication the lectures on *The Political Economy of Art*, and wrote the Addenda to them (Vol. XVI. pp. 105-139). Work for *Modern Painters*, though it was put on one side, did not pass from his mind, and during this autumn of 1857 he made many studies of "Cloud Beauty." He once said that he "bottled skies" as carefully as his father bottled sherries; here, from his diary, are some samples:—

"October 28 [1857].—A grey morning with filmy tracery of hair-cloud, heavy dew—white horizontal mist among trees in walking—open into soft blue sky—with cirri and quiet air."

"November 1. 11,442.—A vermilion morning at last, all waves of soft scarlet, sharp at edge, and gradated to purple and grey scud moving slowly beneath it from the south-west, heaps of grey cumuli—between the scud and cirrus—at horizon [sketch]. It issued in an exquisite day—a little more cold and turn to east in wind; but clear and soft. All purple and blue in distance, and misty sunshine near on the trees, and green fields. Very green they are—the fields, that is; and the trees hardly yet touched on the Norwood western hillside with autumn colour. Note the exquisite effect of the golden leaves scattered on the blue sky, and the horse-chestnut, thin and small, dark against them in stars [sketch]."

"November 3. 11,440.—Dawn purple, flushed, delicate. Bank of grey cloud, heavy at six [sketch]. Then the lighted purple cloud showing through it, open sky of dull yellow above—all grey, and darker scud going across it obliquely, from the south-west—moving fast, yet never stirring from its place, at last melting away. It expands into a sky of brassy flaked light on grey—passes away into grey morning."

Rock at Killecrankie
1857

It was on collections of memoranda such as these, made both in pen and in pencil during a long series of years, that the chapters on the Clouds in this volume were based. Ruskin's study-windows commanded, as we have said,¹ a wide expanse of open country; and in the large garden behind his house at Denmark Hill he had materials ready to hand for his studies in trees and leaves and flowers. The autumn flowers he did not love as he did the autumn skies. "Garden spoiled," he notes in his diary, "by vile chrysanthemums." The poetry of these "autumn fairies," which Maeterlinck has expressed so prettily,² seldom appealed to Ruskin. He loved best the most natural flowers, and "the pensiveness which falls upon us as the leaves drift by in their fading,"³ filled him often with sadness. In later years he disliked the season of autumn, and always longed for the return of spring. Mrs. Severn would sometimes call his attention to the beauty of the autumn woods, but he had made up his mind against them.⁴

1858

Ruskin's work at the National Gallery, which moreover was not allowed to interrupt his teaching at the Working Men's College, did not exhaust his energies during the winter of 1857-1858. In January, February, and April he gave lectures (see Vol. XVI. p. xviii.), and in May there were again *Academy Notes* to be written (Vol. XIV.). By the time that these were off his hands, and that he had finished the arrangement of the Turner drawings, he was thoroughly tired out,⁵ and he set forth in May for a long holiday in Switzerland and Italy. On this occasion his parents did not accompany him, and the daily letter to his father gives us full particulars of his movements and impressions. "I mean," he said to his father (Calais, May 13, 1858), "to write my diary as much as I can by letter; it will amuse mamma and you, and be just as useful to me as if in a book."⁶

¹ Vol. III. p. xxviii.

² In *The Double Garden* (1904).

³ See below, part vi. ch. viii. § 20 (p. 100).

⁴ Herein Ruskin was of one mind with Burne-Jones. "I hate the country," wrote the painter during an autumn visit. "I remember," explains his biographer, "his dread of anything that appealed to the sadness which he shared with all imaginative natures, who 'don't need to be made to feel,' he said, and I believe that this 'hatred' was partly an instinct of self-preservation from the melancholy of autumn in the country" (*Memorials of Edward Burne-Jones*, 1904, vol. i. p. 211).

⁵ See Preface, § 3; below, p. 5.

⁶ The itinerary of this tour, on which Ruskin was accompanied by his servant Crawley as well as by Couttet, was as follows: Calais (May 13), Paris (May 14), Bar-le-Duc (May 16), Bâle (May 18), Rheinfelden (May 19), Brugg (May 27),

He stayed a few days in Paris, visiting there the Count and Countess de la Maison; she was the sister of Adèle. As soon as he reached the open country his sensibility to the charms of French landscape expanded enthusiastically after his severe spell of work at home:—

“BAR-LE-DUC, *May 16*.—Anything so exquisite as this place I haven’t seen this many a day. I thought it was only a village under vines; it is an old French town of strange fantasy, richness, and quaintness, its gardens now all abloom with that purple tree which you remember at Meaux, the *Arbre de Judée*, and nodding lilac, over grey walls with strange Italian wealth of sweet herbage about them—wild strawberry and hawthorn white beside all the walks between the vines; low-roofed cottages just like Italy, with the Italian tiles, which I am amazed to see thus far north, and an old bridge with a little chapel on it and another bridge seen through it, and the hills all green-brown with budding vines far away down each river-side.”

And in another letter, written later on the same day:—

“I’ve had another exquisite walk among the vines; the sun coming out clear and soft, showing through the hawthorn hedges with fresh rain upon them; and the nightingales making such a noise, it was almost as bad as the children, who are very shrill-voiced here, and not sparing, in use of the faculty. But I delight so in the vineyard walls, for it is a Jura limestone country and they are rough built, and go winding about under the hills, so [pen-and-ink sketch of wall and vineyard], with rich tiled coverings on the tops, held down by loose stones; most difficult to draw well, but exquisite when well done; and when the walls stop, come banks of potentilla leaves and forget-me-nots and veronica in blossom, and the soft French air breathing over all so tenderly.”

The tour which thus began so pleasantly lasted four months; and it became a long journey in more than one sense. He was to be led into trains of thought and study which largely modified his artistic standpoint, and which made the criticism in the fifth volume of *Modern Painters* different, in some vital points, from that in its predecessors.

Bremgarten (May 28), Zug (May 30), Brunnen (June 3), Fluelen (June 9), Hospenthal (June 11), Bellinzona (June 12), Locarno (July 4), Bellinzona (July 6), Isola Bella (July 9), Baveno (July 10), Arona (July 14), Turin (July 15), St. Ambrogio (August 14), Turin (August 16), La Tour (August 20), Turin (August 21), Susa (August 31), Lauslebourg (September 1), Annecy (September 3), Bonneville (September 6), St. Gervais (September 7, a day’s expedition to Chamouni), Bonneville (September 10), Geneva (September 11), Paris (September 12).

From Bar-le-Duc Ruskin went to Bâle—starting, we may note, at four in the morning, breakfasting at Strasburg, and reaching “The Three Kings” in time for dinner. “Up at four this morning,” he writes from Bâle, and “walk in intense sweet sunshine till six.” From Bâle he drove over to Rheinfelden, where he stayed a week. One of the objects of his tour was to identify the scene of some of Turner’s sketches in the National Gallery:—

“RHEINFELDEN, *May 19.*—I was just in time here; the bridge is standing, but I should think will not be allowed to stand more than another year, it is too pretty. I was too late at Basle. They’ve put iron arches instead of the old wooden ones between the bridge piers, and taken the roof off the old chapel in the middle and put on a modern flat piece of railroad station work, so there’s an end to general views of the town of Basle.”

“*May 20.*—If you want to see where I am, just call at the National Gallery as soon as you go back to town, and ask Wornum to let you look at the frames Nos. 86, 87, 88, 89, 90; they are all very like, except only that the town, which Mr. Turner has made about the size of Strasburg, consists of one street and a few lanes, and what he had drawn as mountains are only the wooded Jura, but pretty in shape. I have got very comfortable parlour and bedroom, looking out on a fountain and statue of Tell; behind is Crawley’s and Joseph’s¹ room, opening from mine and looking out on the Rhine, which rushes past over a rocky bed, all foaming under the bridge:—blue and white; beyond are the hills of the Black Forest. The garden at the back of the Jura is full of tulips and lilac (honeysuckle just budding), and slopes to the river side—an arbour of rose-trees, not yet in flower, runs out quite to the water, under the walls of a ruined Gothic chapel with beautiful traceried windows filled with timber [sketch]—it is used as a timber shed. But the most beautiful thing of all is the old moat round the whole town, now filled with the sweetest possible gardens, chiefly in flower with white narcissus and deep red tulips,—not striped, but one mass of red, bloomed with blue like a plum, and others purple; the grey walls above covered with ivy, and with all their towers yet unfallen: you will see them in Turner’s sketches. And all the plain round full of apple-trees, partly in blossom, and bright green corn.”

“*May 24.*—I am getting on very well with my drawing; the worst of it is that unless it be as good as Turner’s, it doesn’t please me; so that on the whole I am seldom pleased, and I find it very difficult to sketch after having accustomed myself to finish; but I force myself to it.”

¹ Couttet; for whom see Vol. IV. p. xxv. n.

The old moat described in one of these letters is the subject of the drawing which was engraved for Plate 84 in *Modern Painters* and entitled "Peace."¹ Another of his drawings of Rheinfelden is engraved at the same place (Plate 83), being one of those which Ruskin made "to show the exact modifications made by Turner as he composed his subjects." A third is here reproduced in colours.

From Rheinfelden Ruskin went by Stein (looking across the Rhine to the old town of Sackingen) and Lauffenbourg to Brugg. From thence he went over to see and sketch the Castle of Hapsburg. His drawing, with the letters referring to it, is reproduced in Vol. XVI. (Plate IV. and pp. lxxii., 190). The next halting-place was Bremgarten,² whence he passed to Zug, a town still little known to the tourist—the Swiss Nuremberg, some call it—combining the interest of many old buildings with a sylvan lake and pastoral scenery. The art of the Swiss did not impress Ruskin,³ but the quiet landscape lapped him round in contented peace—

"the blue lake and green pastured hills glowing in soft colours of sunset—no wind moving the woods, only the stock-doves answering one another, and deep-voiced, mellow-worded cuckoos—all the meadows one murmur of bees;—and faint tones of the bells of the villages tolling from beyond their lake, for their services of the eve of the Sabbath; for they keep all the 'eves' here, it being one of the quiet old Catholic-hearted Cantons—still strangely simple, wild, and ignorant; solemn in unprogressive peace."⁴

In his next letter⁵ he returns to the beauty of the sounds in pastoral Switzerland:—

"ZUG, Sunday [May 30].—I was thinking, as I walked here yesterday among the villages, why it was that I am so especially fond of Switzerland, as distinguished from other countries; and I find the reason to be that I am so peculiarly sociable (provided only that people don't talk to me). In all other countries the masses of the people are collected in cities, and one passes through large extents of land without seeing more than a few cottages of agricultural labourers; but in Switzerland the mass of the people is dispersed through the

¹ See below, p. 437.

² Ruskin's letter describing some memorials, which he found there, of Madame de Genlis, is given in Vol. XV. p. 228.

³ Compare Vol. XVI. pp. 190–191, and 191 n.

⁴ Letter to his father, May 30. A preceding portion of this letter has been quoted in Vol. XV. p. 228 n.

⁵ Written later on the same day.

whole country: their power and life are mainly there and one passes, not through field after field of merely cultivated land, but through estate after estate of various families, each having its family mansion, its garden, meadow and corn land, and the cheerfulness and bustle of all kinds of business, together with the various character of old and young, of master and servant, of labour and, in a certain simple way, luxury. There is also a kind of society in the mere redundancy of animal life which is very pleasing to me. In going over the Northumberland moors near Lady Trevelyan's, if you stop and listen, you will hear nothing but the wind whistling—a rattling brook perhaps among some stones, now and then the cry of a curlew, now and then the bleat of a lamb; all plaintive and melancholy. Yesterday, as I told you, the evening was quite windless, and when I stopped and listened there were all the following sounds going on at once:—

"1. Grasshoppers. Very merry indeed.

"2. Grilles (a brown insect, half grasshopper, half fly; more shrill and clear in voice than the grasshopper—like a quantity of little Jews' harps among the grass). Very merry also.

"3. Birds in general, twittering softly, but in great numbers.

"4. Bees. Very loud everywhere.

"5. Runlets of water in the grass and from wooden pipes—a peculiarly Swiss sound, quite different from the noise of stony streams.

"6. Doves.

"7. Cuckoos.

"8. Church bells.

"9. Peasant cracking his whip, some way off in a bye-road (objectionable, except that it seemed to please *him*).

"10. Ditto singing 'Ranz des vaches' (objectionable also, but romantic¹).

"Now that's companionable and pleasant."²

"Zug, June 1.—Do you remember, in the view from the shore here over the lake, how nobly Mont Pilate rises? or was it under cloud? I remember only sketching the Rigi from the little pier (which is now a much larger pier, with an avenue of limes on it), but Mont Pilate is more beautiful from this point than from any that I know, and the Wetterhorn and Eigers are seen beyond. The weather is quite lovely; and the meadow walks in the morning, all bright with dew, and winding from cottage to cottage up the hill sides, are unspeakably lovely."

¹ Compare Vol. 1. pp. 38, 272.

² Compare *Unto this Last*, § 82: "No air is sweet that is silent," etc.

With this impression of pastoral peace, recollections of human endurance and valour mingled in Ruskin's mind and letters, as afterwards in the pages of this volume of *Modern Painters*;¹ for from Zug he drove to one of the sacred spots of Swiss history—"round the shore of the Lake of Egeri; found the field of Morgarten, which is peculiarly distinct and unmistakable, not at all obscure like Killiecrankie"; and then on to Brunnen, in the heart of the Tell country:—

"BRUNNEN, *Thursday evening, 3rd June.*—How you would have enjoyed this evening, here; it is one of their fêtes, and they have been playing pretty music on wind instruments in a boat just off the shore, the cloudless twilight fading over Mont Pilate, and staying long on the snowy mountains of the Bay of Uri—all exquisitely calm, lovely, and solemn—the stars casting long reflections in the lake. I am surprised to find what a complete centre of the history of Europe, in politics and religion, this lake of Lucerne is, as Venice is a centre of the history of art. First, the whole Swiss nation taking its name from the little town of Schwytz, just above this, because the Schwytzers were to the Austrian Emperors the first representatives of republican power, in their stand at Morgarten; then, the league of the three cantons to defend each other against all enemies, first signed and sealed in this little village of Brunnen; followed by the victories of Laupen, Sempach, Granson, Morat,² and gradually gained power on the other side of the Alps in Italy until the Swiss literally gave away the duchy of Milan, the competitors for it pleading their causes before the Swiss Council at Baden; and meantime, the great Reformation disputes in religion making these hills the place of their central struggle, till Zwingli was killed in the battle with these same three Catholic cantons, just beyond Zug on the road down from the Albis; whilst, on the other hand, the Republican party at Geneva was Protestant, and binding itself by oath in imitation of the oath of these three cantons, and calling itself Eidgenossen—'bound by oath'—gets this word corrupted by the French into 'Huguenots,' and so to stand generally for the Protestant party in France also."

In these letters we see how full Ruskin still was of Swiss history. The projected work on Swiss Towns with some Sketch of their History was not to be written; but his studies coloured many a page in

this volume. At Brunnen there was the added interest of identifying Turner's views.

"June 5.—I never saw such exquisite weather in June before, all the mornings cloudless, and the evenings with only so much cloud as helps them to be rosy. If I had known I was going to stay here so long I could have told you, by the help of the Turners, pretty nearly where I was all the day long; which, next thing to knowing I am in my study, ought to have been satisfactory to mama, for this is only a larger study a little farther off. In the morning, when you are at breakfast, I am also at mine at one of the windows of those white houses in Turner's Brunnen. Then in the forenoon, I am on those hills beyond the white cottage on the left in the Lake Lucerne of the drawing-room; and in the evening, under the bank of pines on the left in the Fluelen of the drawing-room, of which the middle distance is about half-way between Fluelen and this."

After some days at Brunnen he moved on to Fluelen, where he met his painter-friend, Inchbold. Ruskin was always meaning to leave next morning, and trying to persuade himself that it was (as he says in a letter of June 9) "an entire humbug and failure of a lake," but the attempt was not very successful:—

"June 9.—The hills were so lovely this morning that I really couldn't leave the place; but positively go to-morrow. To-day I have hardly been doing anything but watch the clouds, as it is the first cloudy and sunny day I have had among the hills; a heavy hailstorm came on last night and the lake was very grand, and this morning all was wreathen cloud among field and pine.

"June 11.—You will be quite vexed at always seeing the same date, but I post this before leaving. My hand shakes, for I have been up since five o'clock working very hard to get the pretty porch of the church here—and I've got it nicely; but it was a race with the sun, who was coming up, up, up over the mountains all the while, and who spoils the porch as soon as he gets into it."

These days on the Bay of Uri were to be fruitful by-and-by. Among the most beautiful passages in the present volume is that which describes the lake and woods of the Vierwaldstätter-see;¹ and in after years Ruskin took pleasure in the thought that, whatever else may have been faulty in his work, he had at least done full justice to the Unterwalden Pine.² He looked back, too, with fondness to "the old boating

INTRODUCTION

days when one could dabble about like a wild duck at the lake shores,"
under the cliffs which "*the beatified modern tourist*"¹ sees only from

a big steamer or in glimpses through a tunnel.

From Fluelen he drove over the St. Gotthard to Bellinzona. He was already familiar with the town, as the lecture on "Iron" shows (see Vol. XVI. pp. 375-411). On this occasion he had intended to make but a short halt there, but was so charmed with the place—in those days before the railway—that he stayed a month:²—

"BELLINZONA, Sunday morning, 13th June.—It is a cloudless morning, cloudless at least to all intents and ends: a white flake or two resting above the hill ridges to the south. A green sea of vines opens wide from below my window, about two miles broad, and endless, losing itself in blue mist towards the hollow where the Lago Maggiore lies, and on each side of the vine-sea rise the large *soft* mountains in faint golden-green and purple-gray. The broad roof still keeps my balcony shaded; the slightest possible breeze is stirring the petals of the geraniums upon it, and stealing in softly through the long windows open to the ground.

[June 14.]—" . . . I have never yet seen elsewhere quite such a place as this Bellinzona. It is now just six years since I left Italy by this very road, and I remember well that even then—wearied and tormented as I had been at Venice—I was much struck with it; but now, coming to it comfortably and from the English winter, it is quite like a wonderful dream. What the climate is you may guess by the white mulberries being now ripe; they are stripping the trees, and the ground is white with fallen fruit, luscious as honey. Imagine this climate in the midst of gneiss rocks—exactly like those of the Garry at Killiecrankie, only vaster—and towering back into ridge beyond ridge of mountain, terrace, and crest; you can hardly conceive how wonderful it is to stand beside the torrents, sweeping in bright waves over these rocks, with all the look of the loveliest Highland stream, but above—instead of mountain ash and low heath—groves and overhanging shades of sweet chestnut and roofs of continuous vine, the rock ferns shooting out among the vine tendrils. I have often seen Italian scenery of this kind in limestone, but never yet in gneiss, flecked with quartz like that of the Matterhorn, and glittering with broad plates of black mica; painted oratories at every turn, and little chapels; the brooks coming down through the very vineyards over stony beds crossed by foot-bridges; the great fortresses showing their towers continually

¹ See Vol. XIII. p. 510.

² His inn was the Aquila d'Oro.

through the gaps in the leaves above; and the people—not pale and diseased as in Val d'Aosta, nor ugly as in Switzerland, but nearly all beautiful and full of quick sight and power, faces burning with intelligence and strength of sensation—useless, on account of idleness, but bright to look upon. And with all this, in an hour and a half, if I like, I can be in the climate of Cumberland, without the damp of it, for the hills rise steep on both sides of the valley to the snow-line—no glaciers, nor perpetual snow, but, for a month yet, snow in all the hollows; and, to make things complete in a not unimportant point, superb trout—none of your white lake-bred things, but stream trout—pink like roses, and fresh like cream.”

These were weeks of quiet thinking and of sketching. Thus he writes from Bellinzona (June 17): “I am much stronger than when I left home, and shall probably soon begin writing a little *M. P.* in the mornings, but I want to get a couple of months of nearly perfect rest before putting any push of shoulder to it.”

The longer Ruskin stayed, the better he liked the place. “I still think this place,” he wrote (June 20), “the most beautiful I have yet found among the hills.” Its history—with the three castles built in 1445 by Italian engineers for the Duke of Milan, and afterwards the residences of the bailiffs of the Cantons of Uri, Schwytz, and Unterwalden—was necessary for his projected work on Swiss towns; the charm of its scenery and surroundings is described in the letters; and the spot was moreover especially liked by Turner. The collection in the National Gallery is full of sketches and memoranda made by him of this most picturesque of all Swiss towns. Ruskin rejoiced, too, in ideal conditions for sketching:—

“BELLINZONA, *June 29.*—My sketching-place here is the pleasantest without exception I have ever had to work in. There are three castles, which anciently belonged to the three forest cantons—the largest castle to Uri; the central one, smaller, to Schwytz; and the smallest, on the side of the hill above, to Unterwalden. The castle of Schwytz, though roofless, is complete in its circuit of wall and tower, which encloses a farm of considerable extent, consisting chiefly of vineyard, with potatoes, corn, and meadow land—variously scattered through the old courtyards and castle gardens. There is no dwelling-house, as at Habsburg, and though the place professes to be always locked up, one has nothing to do but to slide the bolt of the old gate, and slide it back again, and one may choose one's place to sit in all day long, to draw either bits of that castle itself, or either of the other castles, or the roofs and cortiles of Bellinzona, or the valley and mountains—

west, east, or south—always being able to find shade, either of castle wall, or vine, or cherry tree, and with fresh pure turf to rest on when one is tired—nobody ever coming near one.”

His performance did not, in his opinion, equal his opportunities. He was for ever comparing his work in dissatisfied failure with Turner's, and the more elaborate of his drawings at Bellinzona was, he says, “a smash.”¹ Here, we give two of his sketches of the Castle of Schwytz.

From Bellinzona (after a day or two's excursion to Locarno) Ruskin drove to the head of the lake, and took the steamer for Baveno and the Isola Bella. Writing thence to his father (July 8), Ruskin records another of his defeats in sketching; and, in the same letter, mentions a political observation which made a great impression on him, for he used it more than once as an illustration in his economic writings:²—

“No pity nor respect can be felt for these people, who have sunk and remain sunk, merely by idleness and wantonness in the midst of all blessings and advantages: who cannot so much as bank out—or in—a mountain stream, because, as one of their priests told me the other day, every man always acts for himself: they will never act together and do anything at common expense for the common good; but every man tries to embank his own land and throw the stream upon his neighbours; and so the stream masters them all and sweeps its way down all the valley in victory. This I heard from the curate of a mountain chapel at Bellinzona, when I went every evening to draw his garden; and where, by the steps cut in its rock, and the winding paths round it, and the vines hanging over it, and the little patch of golden corn at the bottom of it, and the white lily growing on a rock in the midst of it, and the white church tower holding the dark bells over it, and the deep purple mountains encompassing it, I got so frightfully and hopelessly beaten. It was partly the priest's fault too, for he cut the white lily to present to the Madonna one festa day—not knowing that it was just the heart of my subject—and a day or two afterwards he cut his corn (and planted languid little lettuces or some such thing in its stead), which took away all my gold as before he had taken all my silver, and so discouraged me.”

By the time he was on the lake he had persuaded himself that he cared no more for the hills:—

“I think the last three or four years,” he writes (Isola Bella, July 9), “have completed a change in me which began some ten

Bellingona. 9R. 1853

Bellingona
1858

years ago, and which has enabled me to sympathise with you almost entirely in your feelings about mountains—almost (for I still differ a little in liking glaciers and loose stones). To my great amazement I felt Hospenthal and the top of St. Gothard—snow, gentians, and all—neither more nor less than melancholy and even ‘dull’! I was glad to get down to Airolo, gladder to get farther down to Faido, gladdest to get quite down among the vines at Giornico and Bellinzona; and now I think the walk on the Simplon road by the lake side here—with soft golden sky over *far away* hills (we must be content, I fear, to acknowledge more justice in Count Chabrellan’s¹ opinion than we used to do), and tender olives and laurels sending softest reflections into the quiet water—far pleasanter than all. I have nearly given up climbing the hills, finding, as somebody used to say, the sweetest views are from the turnpike road, and, climax of all conceivable change, I am actually thinking it will be rather amusing to ‘see the palace’ at Turin!!!

“I saw yesterday, by way of farewell to Bellinzona, almost the only ‘ideal’ thing I have ever seen in my life; the only piece of human nature which would have made into a St. Gothard vignette, or an early Raphael picture, without the slightest alteration or ‘improvement.’ It was a group of three children—a girl of about twelve teaching her little brother and sister to sing. They were sitting on a little bank under a vine trellis at an angle of the path, so that I came upon them suddenly; all three *quite* beautiful, and—better—quite clean, even to the bare feet—bare altogether in the two youngest—the elder girl’s being thrust into the rough sandal made of a piece of wood with a broad band of leather across the instep, which the peasants of the Tessin wear universally. She was working at some needlework as she sate, the two others leaning against her, watching her face as she led their chant. When I came upon them she stopped, looking up with a slight, reserved, gentle smile, raising her eyes only, not her head; when I passed on, they went on with their singing—their favourite Madonna hymn. I think the peasants hardly ever sing anything else; but one never tires of it, except in the woful feeling of its never doing any of them the least good. They quarrel with much louder voices than they sing.”

From Baveno Ruskin climbed the Monterone, and condemned it as the stupidest “of all stupid mountains—grass all the way, no rocks, no interest, and the dullest view of the Alps I ever yet saw in my life” (July 13). At Arona he stopped a night and made some notes on Turnerian Topography there,² and thence he went by rail to Turin.

¹ Count Chabrellan was the husband of one of Adèle’s sisters.

² See the letter cited at Vol. XIII. p. 457.

There he stayed five or six weeks, enjoying the town life after his seclusion in the mountains:—

“TURIN, *July 15*.—It is just two months since I arrived late at Bar-le-Duc from Paris, and was shown up the rough wooden stairs to the rougher room of a French country inn. With the exception of a single evening at the *Trois Rois* at Basle, my life since has been entirely rural, not to say savage—it having been my chance or need to lodge in an unbroken succession of either primitive or decidedly bad inns. I am very sorry to say that after this rustication I find much contentment in a large room looking into your favourite square, a note or two of band, a Parisian dinner, and half a pint of Moët’s champagne with Monte Viso ice in it.”

The diary (still in the form of letters) shows him as keenly observant as ever, noting, for instance, the contrasts between French and Italian dress, and studying “the Paul Veronese types” in the streets.

“I have made up my mind,” he writes (*August 19*), “that it is quite impossible for anybody to be a figure painter in the North, except in the stiff Holbein way. The myriads of beautiful things one sees in this climate—where heads are always bare, and generally necks and arms; where people live in the open air, and in walking along a street, one walks through household after household, watching all their little domestic ways of going on—are more to a real painter than all the Academy teaching he could get in a lifetime.”

The comfort and gaiety of Turin—still, it will be remembered, the capital of the Sardinian kingdom—made Ruskin in the mood to enjoy the pictures by Paolo Veronese which are among the principal treasures of the Gallery in that city:—

“I assure you,” he had written (*July 15*), “I do miss you very much, and especially here, where I used to grumble so at being kept sometimes; but my mind is much altered. I do not think the alteration in all respects a gain—in some it is certainly, and I hope the increased love of order and splendour is no harm. I now like much better walking up the pure white marble staircase of this inn than I do the rickety wooden ladders of Bar-le-Duc or St. Gothard; therefore, I enjoy also Paul Veronese much more than I used to do, having more sympathy with his symmetry, splendour, and lordly human life. I have been to the Gallery this morning and find three Paul Veroneses of great size and intense interest; one *consummate* Vandyck with full-sized horse—three or four good average Vandycks; a second-rate, but genuine Rubens, or two; five or six genuine and very perfect Flemish pictures, including a valuable early

Rembrandt; five or six early Italian pictures of interest; and to crown all, the unexpected treasure of a Madonna and Child of Angelico, quite first-rate. I find the officials polite, the rooms cool, and nearly empty—without draughts—sketching allowed without any trouble, the band playing nearly all the morning under the windows, and the upshot of all is that you may now think of anything you wish to say, or send, at your leisure, and send it me here, as I shall certainly not stir for a week at least, and will wait at any rate for the answer to this letter—and as much longer as said answer may require my staying. A great many things came into my head about the pictures, which I shall write in these letters; so you must be prepared for ‘Note on the Gallery of Turin.’”¹

To the studies thus commenced in the Gallery at Turin Ruskin always attached a turning-point in his mental development, so far as the criticism of art was concerned. He partly traces the path of his critical pilgrimage in the Preface to this volume. He had started out spell-bound by the “physical art-power of Rubens.” Then, under strong reaction, he fell into the arms of the Primitives, and Angelico was the god of his artistic idolatry. He was fully conscious of the power and charm of the Venetians, but he regarded their art as “partly luxurious and sensual” (below, p. 9), and their religion as insincere. His study of Veronese at Turin, and afterwards of Titian in the German Galleries.

¹ Various “Notes on the Turin Gallery” were duly sent to his father—partly in the letters themselves, sometimes as enclosures. He thus noted:—

1. Vandyck’s “Prince Carignano” compared with Vernet’s “Charles Albert.” The MS. of this he used as “copy” for *Modern Painters*, vol. v. pt. ix. ch. vii. § 25 *n.* (see p. 358).
2. Vandyck’s “Children of Charles I.” The MS. of this note is unknown to the editors. There is an allusion to the picture in pt. vi. ch. x. § 5 (p. 118); and under No. 3 there are some further notes on the picture, there given.
3. Lomi’s “Annunciation.” The MS. of most of this note, and of the whole of the next, is in possession of Miss Blanche Atkinson of Bournemouth, at one time in constant correspondence with Ruskin. Passages from it are quoted on the next page. (Another piece of the MS. of the note is among the MSS. of *Modern Painters*.)
4. Poussin’s “Margaret.” Some of this note is given below, p. 324 *n.*
5. Wouvermans’ “Battle-piece.” The MS. of this note Ruskin used as “copy” for *Modern Painters*, vol. v. pt. ix. ch. viii. §§ 7, 8 (see p. 367).

Here his numbering comes to an end. But probably there was a No. 6, viz. Angelico (as in the above letter he notes “an unexpected treasure of an Angelico” at Turin); and doubtless the chapter “Wouvermans and Angelico” was thus suggested.

Of course there was a No. 7—“Queen of Sheba,” fully described in successive letters (Vol. XVI., Introduction and p. 185), and in this volume, p. 293 (where again he probably used up the MS. “Notes”).

For other notices of pictures in the Turin Gallery, see Vol. XVI. p. 192 (Albani’s “Four Elements”); and in this volume, p. 336 (Veronese’s “Magdalen”); p. 358 *n.* (Vernet’s “Charles Albert”).

drew him away once more from the Purist to the Naturalist ideal, and Titian and Veronese became to him standards of "worldly visible truth," no less than of perfection in art—the earlier school, "worshippers not of a worldly and visible Truth, but of a visionary one doing less perfect work." Ruskin was to undergo one other transition and no more—discovering at Assisi in 1874 "the fallacy that Religious artists were weaker than Irreligious." The story of these "oscillations of temper and progressions of discovery" is fully told by Ruskin himself in *Fors Clavigera*.¹ It is with the last stage but one that we are now concerned—the stage which Ruskin had reached when he sat down to write the concluding chapters of *Modern Painters*, with "the enchanted voice of Venice" sounding in his ears. The new problems which began to compel his attention as he worked and wondered before Veronese's pictures at Turin are stated very clearly in one of those "Notes on the Turin Gallery" mentioned above. Among the pictures thus noted by him was an "Annunciation" by Orazio Lomi:²—

"Besides being well studied in arrangement, the features of both figures are finely drawn in the Roman style—the 'high' or Raphael-esque manner—and very exquisitely finished; and yet they are essentially ignoble; while, without the least effort, merely treating their figures as pieces of decoration, Titian and Veronese are always noble; and the curious point is that both of *these* are sensual painters, working apparently with no high motive, and Titian perpetually with definitely sensual aim, and yet invariably noble; while this Gentileschi is perfectly modest and pious, and yet base. And Michael Angelo goes even greater lengths, or to lower depths, than Titian; and the lower he stoops, the more his inalienable nobleness shows itself. Certainly it seems intended that strong and frank animality, rejecting all tendency to asceticism, monachism, pietism, and so on, should be connected with the strongest intellects. Dante, indeed, is severe, at least, of all nameable great men; he is the severest I know. But Homer, Shakespeare, Tintoret, Veronese, Titian, Michael Angelo, Sir Joshua, Rubens, Velasquez, Correggio, Turner, are all of them boldly Animal. Francia and Angelico, and all the purists, however beautiful, are poor weak creatures in comparison. I don't understand it; one would have thought purity gave strength, but it doesn't. A good, stout, self-commanding, magnificent Animality is the make for poets and artists, it seems to me.

¹ Letter 76 (March 1877).

² Orazio Gentileschi, called Lomi after his step-father, born at Pisa in 1562; died in 1647 in London, where he had worked and resided for twelve years. There are pictures by him at Marlborough House and Hampton Court.

"One day when I was working from the beautiful maid of honour in Veronese's picture, I was struck by the Gorgeousness of life which the world seems to be constituted to develop, when it is made the best of. The band was playing some passages of brilliant music at the time, and this music blended so thoroughly with Veronese's splendour; the beautiful notes seeming to form one whole with the lovely forms and colours, and powerful human creatures. Can it be possible that all this power and beauty is adverse to the honour of the Maker of it? Has God made faces beautiful and limbs strong, and created these strange, fiery, fantastic energies, and created the splendour of substance and the love of it; created gold, and pearls, and crystal, and the sun that makes them gorgeous; and filled human fancy with all splendid thoughts; and given to the human touch its power of placing and brightening and perfecting, only that all these things may lead His creatures away from Him? And is this mighty Paul Veronese, in whose soul there is a strength as of the snowy mountains, and within whose brain all the pomp and majesty of humanity floats in a marshalled glory, capacious and serene like clouds at sunset--this man whose finger is as fire, and whose eye is like the morning--is he a servant of the devil; and is the poor little wretch in a tidy black tie, to whom I have been listening this Sunday morning expounding Nothing with a twang--is he a servant of God?

"It is a great mystery. I begin to suspect we are all wrong together-- Paul Veronese in letting his power waste into wantonness, and the religious people in mistaking their weakness and dulness for seriousness and piety. It is all very well for people to fast, who can't eat; and to preach, who cannot talk nor sing; and to walk barefoot, who cannot ride, and then think themselves good. Let them learn to master the world before they abuse it."

The laborious study which Ruskin gave to Veronese's great picture is fully set out in another place;¹ the picture itself is described in this volume.² What we may call the revelation of Paolo Veronese had a religious as well as an artistic significance: the two things being indeed, in Ruskin's mind, essentially connected. The process of "un-conversion," as he calls it--the abandonment of his old evangelical faith--was accomplished when he returned from a service in the Waldensian chapel to the "Queen of Sheba" in the Gallery. He has described the process both in *Fors Clavigera* and in *Præterita*,³ explaining in the latter place that

¹ Introduction to Vol. XVI. pp. xxxvii.-xl.

² See below, pt. ix. ch. iii. § 33 (p. 293).

³ *Fors*, Letter 76; and *Præterita*, iii. ch. i. § 23.

“the hour’s meditation,” which ended in his putting away his evangelical beliefs, “only concluded the courses of thought which had been leading me to such end through many years.” The broader view which Ruskin was henceforth to take appears in a note to his lecture at Cambridge (October 1858¹). He has told us how, when he was a boy, he had been trained by his parents to notice some vital distinction whenever he passed from a Protestant to a Catholic canton. On the present journey he had passed from pastoral cantons in Catholic Switzerland to the Protestant valleys of the Vaudois. He had made a little tour among them from his headquarters at Turin:—

“TURIN, *August 23*.—I am so much accustomed now to be disappointed in going to any new place that I was pleasantly surprised at not being very much disappointed with those Protestant valleys. La Tour itself, indeed, is a most disagreeable place, the houses having no character whatever—either Swiss, Italian, or English—they are merely ill-built and clumsy; the valley itself ragged, monotonous, and, for an Alpine valley, mean in scale. But the little side ravines are very beautiful, and, after sermon, I pursued one of the lateral ridges with Couttet for four hours and a half of steady climb at our fastest safe pace, which gives us regularly 1200 feet of perpendicular in the hour. We started from the church door at twelve o’clock, and at half-past four we had got to a peak which, when the weather is fine, must command certainly one of the finest and most interesting views in the world. It was unfortunately not fine, and the Viso, which rises on the opposite side of the valley of La Tour, was veiled half-way down without one rent in the clouds; but on the other side of the ridge, luckily, the clouds lay only in broken heaps at about 2000 feet underneath us, and 2400 above the plain of Turin, which was seen between the rounded heaps and towers of the cumuli in strange gulfs of spotted and tufted blue. Turin itself, and the Superga—about twenty-eight miles away as the bird flies—looked quite near; and on the other side similarly the scattered towns of Piedmont—Cavour, Saluzzo, Bra, Carmagnola, etc., all as clear as on a pocket-map where the clouds opened. Beyond Turin the plain stretched for thirty miles further towards Vercelli; just underneath us lay the whole valley of Angrogna, celebrated in Vaudois tradition, and full of broken walls of rock—every one of which had indeed in its time been a fortress. On the other side, between us and the Viso, first the fertile valley of Luserna, above La Tour, and then a chain of lower mountains which separate it from the valley under the Viso itself; above these the flanks of the Viso, seamed with the ravines of the sources of the Po,

¹ See Vol. XVI. p. 190.

rose gloomily into their grey veil. The air, strangely enough on so exposed a summit, was quite calm, and I lay down for a few minutes on the hill grass—starred with deep crimson, wild pinks (or query, Sweet William—no scent and jagged at edges, this size [sketch])—and could have gone to sleep with perfect safety if I had liked. However, my theological Professor was to come at seven, so Couttet and I started again down hill at a quarter to five, and I believe few people of the respective ages of sixty-eight and forty would have entered the village square of La Tour as the clock struck seven without considerably hotter faces. The Professor had come five minutes before his time, but that was not my fault. I took off my boots and washed my face, and was making him his tea in ten minutes.”

The theological Professor did not convince him that there was any saving efficacy in Protestantism, as such, which was denied to sincere and honest believers of a different creed. “Good and true pieces of God’s work” had been done, he wrote, by stout and stern Roman Catholics among the Swiss mountains no less than by the Vaudois peasants.¹ He was thus reaching what he elsewhere calls the true “religion of humanity”—the religion whose rule of conduct is “that human work must be done honourably and thoroughly, because we are now Men;—whether we ever expect to be angels, or ever were slugs, being practically no matter;” and “that in resolving to do our work well is the only sound foundation of any religion whatsoever.”² This is the principle which in the present volume colours many of Ruskin’s chapters.

Some other thoughts that came to Ruskin in the Gallery at Turin or on the Capuchin Hill and the Superga are recorded in the Cambridge lecture already referred to.³ As always, he observed and recorded the passing effects of cloud and storm, and in the present volume some of the observations taken in the neighbourhood of Turin are recorded. In the town itself glorious sunsets were sometimes to be seen:—

“TURIN, 23rd [July].— . . . In the afternoon I have always ten minutes of a great treat, when the soldiers go back to their barracks down the great street which there seems no end to. They go down precisely at sunset, and the sun sets precisely at the end of the street, blazing down it like a comet, and melting among all the distant houses and their blinds and draperies into one fiery ghost of a street, down which the regiment swings to its band with all its

¹ See his letter to the *Scotsman* of June 6, 1859, referred to in Vol. XVI. p. 190 *n*.

² *Fors Clavigera*, Letter 76.

³ See Vol. XVI. pp. 193 *seq*.

bayonets dark against the sun. I have never seen anything so exciting in stage effect in my life ; and then, just as the band finishes, the sun drops behind the Mont Iseran, the fire dies away, and nothing is seen at the end of the street but the one dark mountain peak, and the zone of twilight above."

"*July 31.*—I had also a very wonderful sunset last night, the first I have had since I have been here. The weather has been both in Switzerland and Italy much too fine to admit of many grand effects ; but yesterday a storm came up in *fragments* along the plain, just like an army in detached columns, with open sky between, and when it got to the Alps they began to play with it in the most wonderful way. First it broke up against them, and great foaming thunder-clouds dashed up here and there just like the spray of tremendous waves broken on the ridge. Then the Alps broke through these spray-clouds, and laid them this way and that on their sides, and made necklaces of them, and threw them out in long sheets far over the plain, shadowing it into deep blue ; while the sun, traversing over the peaks, sent long red rays over the sheets of foam between every gap of the rocks, pieces of pure and perfect blue sky set here and there so calmly in the midst of all the anger ; and a purple range of unclouded peaks retiring one behind another, in the way you are so fond of seeing them—far to the north beyond the Lago Maggiore. Not a soul was there to see. On fine afternoons, when all is quiet and stupid, the people go up to the convent terrace often enough, merely to see the Alps and plains suffused with one yellow mist of light ; but in these stormy afternoons, when all the most wonderful things are doing, nobody stirs out of the streets ; so it is no wonder they declare all paintings of such things to be unnatural."

Among other excursions which Ruskin made from Turin was that to the Sanctuary of S. Michele, the romantic building which crowns the Monte Pirchiriano above the town of S. Ambrogio :¹—

"ST. AMBROGIO, *Sunday 15th [August]*.

"You recollect in coming from Susa to Turin that fine pyramid of rock on the right, with castle on top, dedicated to St. Michael. I had always a great fancy to get up to it ; so yesterday, after finishing my work, I took an hour's quiet rail, and arrived here at four o'clock. I walked up to the castle, and saw some most marvellous playing of cloud about it and up the Cenis valley ; I shall walk up again this evening, and return to Turin by six o'clock train to

¹ Some interesting chapters on S. Michele are contained in Samuel Butler's *Alps and Sanctuaries* (1882).

breakfast and Paul Veronese to-morrow morning. I am sorry to find, however, that though the rough inns gave great zest to the Turin good one, the Turin good one doesn't at all give zest to country rough ones, and my little parlour here, though quite as large as our little friend at St. Martin's—and looking out similarly on a stable-yard—does not at all give me the same satisfaction. There are also rather more cocks and bells in the town than are pleasant, and the whole place is melancholy in its dirt and ruin, the peasants all in rags—good-natured in face and manner, and with the making of worthy people in them, but wholly neglected and neglectful. They say the King of Sardinia is going to bury himself (when he wants burying) in the convent at the top of the hill, instead of Superga;¹ if instead of burying himself at the top, he would bestir himself at the bottom, it would be more to purpose. I wish poor Mrs. Tovey² were young again; I would give her a travelling pension, to employ herself everywhere in dusting and washing, till she was stopped by the police, for making Italy unwholesomely damp. This Piedmont is really the slovenliest part of Italy I have seen. Venice and Verona are melancholy enough, and dirty enough in dirty places; but there is nothing in St. Mark's Place like the moats which surround the castle in the central square at Turin, and are full of rotten gourds, pigeon-castings, rags, and dust."

"SANT' AMBROZIO, *Sunday evening* [15th August 1858].

"I have been up again to St. Michael's, and this time I went into the monastery, and certainly as the little scene I saw at Bellinzona was the most complete piece of ideal I ever met with, so this monastery is the most tremendous bit of romance. Its buildings are on the precipice side, wholly of the ninth to thirteenth century—all the modern work being luckily towards the hill, inside where the aspect is not so wonderful—and the rocks are of serpentine, which is, in its Alpine form, the most fantastic of all rocks, rising, itself, in piers and buttresses rather than crags, and mingling with the walls, not merely outside, but inside of the building. There is little carving, except some rude figures on the capitals outside; but within, the great staircase which ascends to the chapel is the most striking thing of the kind I ever saw. Imagine a Norman (*i.e.*, tenth century) vaulted staircase with pillars from sixty to eighty feet high, and its winding stairs at least twenty feet wide, broken in upon irregularly by huge masses of the serpentine rock, mixed with the buttresses

¹ The Superga had contained the remains of most of the members of the Royal house, but King Charles Albert caused several of them to be removed to S. Michele. Victor Emmanuel lies in the Pantheon at Rome.

² "Our perennial parlour-maid": *Præterita*, ii. § 108.

for beauty. . . . The woods and fields about Bonneville and Cluse on the Brezon slopes and Reposoir valley are quite ineffably lovely." He walked over to Chamouni to see the Couttets, and then returned by Geneva to Paris (where he saw the Brownings), and so home. He had much work before him—much food, too, for thought received during his travels to be digested. The quiet country lanes which then surrounded his home were grateful to him. Such hours are noted in the diary:—

"Monday, October 18th.—The loveliest two days, Saturday and yesterday, I ever saw at this season. On Saturday, sitting for an hour in the lane under Knight's Hill, the ground covered with gossamer, all the fields rippling with a stream of sunshine like a lake, yet no perceptible wind."

1859

"The winter was spent mainly," says Ruskin of 1858–1859, "in trying to get at the mind of Titian; not a light winter's task."¹ But he had much else on hand—a paper for the Social Science Congress, an address at Cambridge, a second letter to Acland on the Oxford Museum (see Vol. XVI. pp. xviii.–xix.). There were friends across the sea who rejoiced in his activity and growing influence. "It is delightful to hear," wrote Mrs. Browning from Rome on New Year's Day, "of all you are *permitted* to do for England meanwhile in matters of art." "Go on again," added Robert Browning, "like the noble and dear man you are to us all, and especially to us two out of them all. Whenever I chance on an extract, a report, it lights up the dull newspaper stuff wrapt round it, and makes me glad at heart and clearer in head."² Then came the lectures at Manchester and Bradford; Ruskin's movements at the time of their delivery are traced in another volume.³

His father regretted all this dispersion of energy, and the delay which it caused to the completion of *Modern Painters*. But for a little tour which he worked in with the lectures in the North Ruskin was able to make a good plea: he was continuing his studies in Turnerian Topography:—

"BOLTON BRIDGE (*February 25, 1859*).—This is just a splendid place, and never was there so true a drawing as our Bolton. The hills are just about five times as high as they really are, but they

¹ See Preface, § 4; below, p. 6.

² *Letters of Elizabeth Barrett Browning*, 1897, vol. ii. pp. 300, 302.

³ See Vol. XVI. pp. lxi.–lxiv.

are enlargements of Facts, and more facts than the reality and the trees and shingle bank are all there."

"BOLTON, *Sunday (February 27)*.—Nothing can well be more splendid than the dark moors on the other side of the valley against the clear blue of the sky to-day; and their brooklets and rocks in the gleus are as good as those of true mountain country, the limestones forming beautiful shelves and steps for the brooks to leap over."

"BOLTON BRIDGE, *Monday (February 28)*.—Do you ever recollect noticing a white sort of heaped cloud in this part of the world? It looks exactly like a piece of the moorlands covered with snow, rising above the real dark moorland, like this—[sketch]. I never saw anything like it elsewhere. It seems to mean wind."

"BOLTON BRIDGE, *Tuesday (March 1)*.—I am very sorry to stay away from home so long, but it is necessary for me to see these Yorkshire subjects, which I look upon as on the whole the chief tutors of Turner's mind, before finishing my fifth volume. His exaggerations are not entirely excusable, and it is very interesting to determine exactly where, and when, he first went wrong. He is to landscape precisely the kind of romance writer that Scott was to history, at once truer and falser than anybody else."

"KNARESBOROUGH, *Wednesday evening (March 2)*.—Is it not curious that those trees have remained so like at Bolton, though it must be fifty years—or forty-five at the very least—since Turner made his sketch."

"RICHMOND, *Thursday evening (March 3)*.—Knaresborough is a grand place, grander than this on the whole, the houses much rougher and more picturesque, and the cliffs higher. It is curious that Turner has not got what seems to me quite the grandest point of this place; and to make out his views from other places, he has to make the bank immensely steeper than it is. But in the oldest Richmond¹—when the girl is gathering the flower, or picking up the stone for the dog—the winding path, and small house beyond, and large tree are still all there. I am very much surprised to find the trees so little altered."

"RICHMOND, *Friday evening (March 4)*.—I have had a beautiful day here—could not have been more fortunate—being precisely the weather of the Richmond with far distance; and for once, Turner has hardly done justice to that distance—it is one of the most beautiful, richest, bluest, most variable in flow of low hill, that I ever have seen. Turner combines the other features of the scene in the strangest way;

¹ This is the drawing engraved by W. R. Smith as the second Plate in *Richmondshire*. A piece of the foreground is engraved below, in Plate 55: see p. 56.

nothing is where it is, but everything where it explains itself. For instance, the bridge on the left (in the one from the riverside over chimney-piece¹) is in reality far away round the corner of castle: instead of being at *a*, it would be seen if you could see right through the castle to the other side of it, at *b* [rough sketch]. But it is there, and Turner had no other way of explaining that it is there but by bringing it into sight. I am delighted to have come in time to ascertain the fact of the brick chimney built up by the square tower, which he has marked so particularly in that same drawing. The bed of the Swale under the castle is fine, but the water not clear."

"HAWES, *Sunday (March 6)*.—I had a most interesting drive yesterday, and Aysgarth force is out and out the finest thing I've seen in water in these islands; or perhaps the Falls of Clyde may be better; but nothing else certainly can come near this for body of water, and one gets as close to it as to the fall of the Rhine, the rocks going out in perfectly flat tables above it. The country round large in scale and beautifully rustic—wild walls everywhere—moss, crag, and mist, wilder than in Highlands. This is a fine little inn—white home-made bread, fresh trout, etc.—and really something like mountains visible out of the back window. Didn't see Hartleap Well yesterday, however."

"SETTLE, *7th, Evening*.—The drive to-day has been the most interesting by far I ever had in England; a truly wonderful country—like the top of the Cenis for desolation. Ingleborough a really fine mass of hill, the streams in the limestones behaving in the most extraordinary manner, perpetually falling into holes and coming out again half a mile afterwards. Pen-y-Ghent a fine hill too; and a wind blowing over the whole that seemed as if it would blow Ingleborough into Lancaster Bay. I got out near the top of the moors as the horses were feeding, just to feel what the wind was, and walked backwards and forwards for half an hour, and felt all the better for it. I should think I had got fresh air enough to last me for six months, at least.

"The afternoon got splendidly clear as I got down off the moors, and the mosses on the stone walls were just one perpetual blaze of green fire; such curious villages too—all stone-built of course, and on stone: nothing else to build upon—fitted into the little hollows by the streams—nice respectable three-windowed houses—that kind of thing [sketch]—with tidy gardens and doors with brass knockers and all sorts of respectabilities, standing on ledges of the roughest rock just jutting over the rushing streams, where one would expect nothing but a Highland bothy—stepping-stones instead of bridges up to the doors."

On returning home from this Yorkshire tour, Ruskin prepared for

¹ This is the drawing engraved by J. Archer as frontispiece to *Richmondshire*. For another note upon it, see Vol. XIII. p. 431.

publication under the title *The Two Paths* the lectures he had recently given, and next wrote his *Academy Notes*. Then he was ready for another Continental tour. It was to be the last on which his parents accompanied him, and before they reached their favourite haunts in Savoy and Switzerland they broke new ground.¹ Ruskin had been asked somewhat pointedly by the National Gallery Site Commission whether he had “recently been at Dresden” or was “acquainted with the Munich Gallery.” He had never been to either place.² This omission he felt bound to repair. Moreover he was now particularly anxious, in connection with his studies of Titian, to see the works of that master in the German galleries.³ They went accordingly by Brussels to Cologne, Düsseldorf, Berlin, Dresden, and Munich, and Ruskin’s diary is mainly occupied with notes on the pictures at these places. Most of these are now printed in an Appendix (p. 488), in order to illustrate various passages in the present volume. Among the notes made at Dresden, many references will be found to pictures discussed in the text. Ruskin was especially delighted with the Family Group by Paolo Veronese (see below, p. 290), and devoted much study to it. A careful copy of a portion of the picture, which he made at this time, is preserved at Brantwood, and is here reproduced. To the great Raphael in the Dresden Gallery he does not refer in the present volume, but his note in the diary is worth putting on record—if only to show his independence of accepted opinions. In earlier days, when he wrote of the picture on report or in the light of engravings, he took it as “a standard of beauty”;⁴ his impressions, when he actually saw the picture, were very different:—

“SAN SISTO.—If one supposes oneself—looking at the Madonna—to have one’s back to the north and to be looking straight south (the Madonna coming out of the south as it were), then the Madonna

¹ The itinerary of this tour was as follows: Calais (May 20), Brussels (May 21), Aix-la-Chapelle (May 25), Cologne (May 29), Düsseldorf (May 30), Münster (June 1), Hanover (June 2), Brunswick (June 5), Magdeburg (June 8), Berlin (June 9), Dresden (June 17), Königstein (June 25), Dresden (June 26), Leipsic (July 1), Hof (July 5), Nuremberg (July 5), Augsburg (July 12), Munich (July 13), Kempten (July 25), Constance (July 27), Schaffhausen (July 30), Baden (August 1), Berne (August 8), Thun (August 9), Interlachen (August 22), Thun (August 23), Berne (August 25), Neuchâtel (August 27), Lausanne (August 28), Geneva (August 31), Bonneville (September 3), Chamouni (September 5), Montanvert (September 7), Bonneville (September 8), Geneva (September 9), Lausanne (September 10), Neuchâtel (September 12), Bienne (September 14), Bâle (September 15), Strasburg (September 17), Nancy (September 19), Chalons (September 20), Paris (September 21 to October 1). Ruskin gave some account of his German tour in a lecture at the Working Men’s College: see Vol. XVI. pp. 469–471.

² Questions 33, 35. See Vol. XIII. p. 543.

³ See Preface, § 4; below, p. 6.

⁴ See Vol. IV. p. 369.

is lighted from the north, Christ from the north-east; St. Barbara from the east, St. Sixtus from the west; his mitre from the north-west, and the clouds and curtains from nowhere in particular. The effect of the Christ depends mainly on his having a large white dot in one eye, and none in the other; the irises very round and black and staring; body muscular and herculean; the hair is very beautiful. There's a little Christ in a Palma Vecchio¹ hugging St. John round the neck, looking back and up at the same time to a saint in yellow who sits looking on (the Madonna being recumbent), who is worth a myriad of Raphael's—so also the heavenly little Christ in Veronese's Magi. The Madonna has no light on either eye, so that the white dot on the infant's produces great effect. Sixtus mean and contemptible."

Of the Munich Gallery, also, Ruskin made notes, and many of those, given in the Appendix, are of interest in connexion with passages in the present volume. His notes were accompanied, as usual, by many pen-and-ink sketches, too rough for reproduction, but illustrative of his close study. At Munich, too, he made a careful water-colour copy of the little girl in one of Vandyck's portrait-pieces (see below, p. 495). With the Berlin Gallery—alike in its arrangement and its contents—Ruskin was much delighted. Among its greatest treasures he reckoned Holbein's portrait of George Gyzen; this he described in his paper on "Sir Joshua and Holbein."² A general impression of the Gallery, with an account of this German tour generally, is given in a letter to Clarkson Stanfield, R.A.:³—

"DRESDEN, 23rd June [1859].

"DEAR MR. STANFIELD,—Time goes fast when it is travel spent, and I am ashamed to think how long it is since we left home, and I have not told you—as you said you would like me to do—what adventures we have met with in the disturbed state of the Continent. In the first place, we met with a very excited old gentleman in Brunswick, who told us the French were in Milan, and looked at us fiercely as if he thought it was our fault. We told him it wasn't, and that we wanted the sexton to let us into the Cathedral, upon which the old gentleman went to get him for us; and in the second place, we saw fifteen thousand fighting men in helmets of this shape [sketch] (the ornament at the top being in appearance a hall candlestick and its function a ventilator) march past Prince Frederick William at Berlin. We were smothered in dust, and very late in getting breakfast, but the

¹ This is the "Holy Family" with St. Joseph and St. Catherine, No. 191.

² *Cornhill Magazine*, March 1860; reprinted in a later volume of this edition.

³ This letter, and the one next following, have been communicated to the editors by the artist's son.

fifteen thousand candlestick men did us no other harm. In the third place, we heard the Austrian National Hymn played three times over to some people in a tea-garden in Hanover, but no popular movement followed.

"And in the last place, five boys in paper caps made a very disagreeable noise for three-quarters of an hour in a back lane under my window at Berlin, one evening, which I have reason to think was intended for an imitation of Prussian military music playing national airs. I have no remembrance at present of any other inconvenience resulting from the disturbed state of the Continent.

"I was thinking of you yesterday as we were watching a ferry-boat cross the Elbe with a cart and horse in it, just one of the pretty little flat bits with a strong figure group which you like. And I thought of you very often among the shining Dutch brown boats and picturesque Meuse ones. Those Dutch boats are certainly very pretty, but I don't like the Dutch water. I never saw such a pestiferous extent of pond as in the lower town of Brussels—a sort of canal part with handsome houses on each side, and very much in its own character what the Thames would be without a tide. This Elbe is a fine river however, and its hill shores beautiful with vines and roses. The foxglove, I see, is here a cultivated flower. The Gallery at Berlin surprised me; it is not usually spoken of by travellers with much interest, and it is far the most beautiful in aspect and arrangement I have ever seen. The Louvre is splendid, but this Berlin one has pillars of solid marble of exquisite beauty, floors of mosaic, walls of fresco, which, though not of the best, give it a dignity much greater than that of the Louvre. The collection of pictures is far richer than I expected; it is a fine cast of pictures too, for though they have only one Titian, they have a noble series of earlier Italian masters, and of early Flemish—Van Eyck and Memling, good Vandycks, and the best Holbein I ever saw in my life. They have three Raphaels, one very good.

"Here, though their renowned group of pictures is indeed magnificent, the setting of them and general tone of the collection is bad. Instead of early Italian they have late Carlo Maratti, and such like; instead of early Flemish, quantities of Dows and Ostades, and so on, mixed with an enormous quantity of mere rubbish, and with rascally black Spanish things, Riberras and Zubbarans. And all these pictures are shown to disadvantage, not excepting even the Madonna di San Sisto; she has a room to herself, but it is in a feeble light. The Dresden Venus is twelve feet above the eye.¹

"Don't trouble to answer this, I'll write again when I get to

¹ Presumably the Sleeping Venus, lying on a red drapery, now attributed to Giorgione.

Switzerland; my servant who delivers this will tell me how you are. My father and mother join in sincerest regard.

“Believe me, dear Mr. Stanfield,

“Faithfully and respectfully yours,

“J. RUSKIN.”

We have often seen already how poor an opinion Ruskin had of modern German art; the closer study of it during this tour did not modify his views, as will be seen from this later letter to the same correspondent:—

“THUN, 22nd August [1859].

“DEAR MR. STANFIELD,—I should have written again before now if I had not been in a state of sulkiness and suffering under German art which was wholly inexpressible; having escaped from its influence and got to the lakes and hills, I am slowly recovering a little temper and appetite and the use of my tongue, which I can't use more truly than in assuring you, first of all, that English painters do not think half enough of themselves. They are veritably the only painters of landscape existing—and they and the French are the only living painters of anything. German landscape is, as you must well know (for that much I knew before going to Germany), fit only for fire-screens and card-cases; but what I did not even suspect before going to Germany is that all their boasted figure-painters' work is as utterly abortive. They have much real feeling and extensive knowledge and considerable power of thought, the whole rendered *utterly* valueless by the intensest, most naïve, most ridiculous, most absorbing, most hopelessly ineradicable vanity that ever paralysed Human art. I could not have believed anything so ludicrous unless I had actually seen it. If every German painter walked about in the streets with a spread peacock's tail pinned to his breeches by way of decoration, they would not be more manifestly, not one whit more amazingly ridiculous than they are in the way they have exhibited their vanity in the frescoes at Munich.

“Of these, Kaulbach's are the most ludicrous, Cornelius's the most atrocious. Hess's the least excusable—for he might have been a painter but for his vanity, while Kaulbach and Cornelius never could have painted under any circumstances. But enough of them.

“I saw a vast mass of Dutch pictures of good quality (as Dutch) at Dresden and Munich, and dislike them—the landscapes I mean—more than ever. Gerard Terburg does some fine things when he is simple (in figures), but I really think you Academicians ought to help me a little in abusing those precious grey things of the Dutch landscapists. There is a most elaborate Wouvermans at Munich—a hunting party by a lake—a broad lake with hills and villas and all sorts of ruins and

things on its shores, and actually the water is drawn in flat grey like a slate table, not one reflection nor any ripple on its surface.¹

"If you and Creswick and a few more Academicians would tell people when you are talking quietly with them that this kind of thing is not good painting—whatever its reputation—instead of scornfully leaving the poor public to find it out for itself too late, you would do quite incalculable good.

"We came down to Munich from Lindau and Constance. The old wooden building at Constance (in the lake), which you drew by moonlight, is gone. Fine pier instead for steamers. Your old subject in the town of Schaffhausen (the upright) is still safe—curiously uninjured. The fall of the Rhine is much improved, the chateau of Lauffen being nearly all rebuilt in modern pastrycook Gothic, and a railroad bridge carried over the river above the fall [sketch].

"There is, however, an advantage in this which the creatures never thought of—one had no idea before of the real quantity of water in the rapids. It is, as you know, all green and pure, and to me it was more delightful—looking at it in its irregular depths and strength among those rocks—than even in the fall itself. But the general aspect of the fall is wholly destroyed, and what is much worse, the quantity of steamers on the lakes I think slightly foul the water in these small ones. This Thun is only ten miles long, and for the most part only two or three hundred feet deep, with gravelly shore; and I think steamers up and down it four or five times a day keep the sediment from settling as completely as it used to do, or perhaps eyes at forty don't see such clear water as they do at twenty. But I think I have accustomed myself to accurate estimates, and neither this lake nor Constance seem to me as clear as they were. We have all kept well. I hope this letter will not find you at home, but that you are enjoying yourself with recovered health on some nice southern coast, or—who knows—shall we have a battle of Solferino, with gardens in the distance, in the Academy next year? *Do, pray!*

"Always, dear Mr. Stanfield,

"Faithfully and respectfully yours,

"J. RUSKIN."

Further notes and impressions on modern German art occur in Ruskin's diary; some of these are also given in the Appendix, as illustrating what he says in this volume about "German heroics."² A few appreciative notices of the early German painters will be found; but in modern German art, whether in painting or in sculpture, Ruskin could find nothing to admire. He was not sorry, we may expect, when

¹ For this picture, see below, p. 365.

² Part ix. ch. viii. § 1 (p. 363).

his work in Germany was finished, and he was free to turn southwards once more. But his visit to Nuremberg made a strong impression on him; it is reflected both in the text and in the illustrations of this volume. During his sojourn in Germany the Franco-Sardinian war with Austria was raging; the battle of Magenta was fought on June 4, and Solferino on June 24. Ruskin was keenly interested on the Italian side, and the English attitude of non-intervention was hateful to him. He threw off a series of letters to the press, containing incidentally some notes on German art: these are reserved for publication in a later volume.¹ The French "breach of faith,"² in the peace of Villafranca, drew Ruskin back in disgust to his other studies. From Nuremberg he went to Munich, and thence to Schaffhausen. Writing to Professor Norton from that place (July 31), he refers to the conclusion of *Modern Painters*:—

"I am at work upon it, in a careless, listless way—but it won't be the worse for the different tempers it will be written in. There will be little or no bombast in it, I hope, and some deeper truths than I knew—even a year ago."³

"I was up at three," he says in the same letter, "to watch the dawn on the spray of the Fall." Next he spent a month in the Bernese Oberland; and then leaving his parents for a while at Geneva, he went yet again to his beloved valley of Chamouni. There, and afterwards at Neuchâtel, he travelled with his friend Mrs. Beecher Stowe and her daughter.⁴ At Chamouni, as usual, he worked hard at the rocks; but his diary shows that his thoughts were turned also to other subjects. There is the beginning, for instance, of an essay on Political Economy. His habitual study of the Bible took the form of notes on St. Matthew's Gospel, and an essay on Faith. His literary companion was Dante.

After ten days in Paris, Ruskin reached home early in October 1859. A little later he went on a visit to Miss Bell's school at Winnington, where he worked upon *The Elements of Perspective*, and then there was no further interruption until *Modern Painters* was finished. The volume was written, in a sense, under pressure—the closest and most compelling that could have been applied—the pressure of entreaty from his father. Ruskin described it in one of his Oxford lectures.⁵ His father had seen

¹ They were reprinted in *Arrows of the Chace*, 1880, vol. ii. pp. 3–21. It is interesting to remember that the same events led to the first prose essay of Matthew Arnold—his *England and the Italian Question* (1859).

² See *Letters of John Ruskin to Charles Eliot Norton*, 1904, vol. i. p. 82.

³ *Ibid.*, p. 81.

⁴ See *Time and Tide*, Appendix (Vol. XVII.).

⁵ "Readings in *Modern Painters*": see a later volume of this edition.

him collecting materials for fifteen years, and was weary of waiting for the conclusion. It was by the first volume of *Modern Painters* that his son had leapt into fame; it would be by this great work, as the father rightly foresaw, that the fame would be most securely established. He yearned to see before he died the end crown the work. Accordingly, "when he came home from the long journey of 1859 and found signs of infirmity increasing upon him, he said to me one day, 'John, if you don't finish that book now I shall never see it.' So I said I would do it for him forthwith, and did it—as I could."

"As I could, not as I would;" perhaps Ruskin was thinking, as he wrote, of this motto of the most minute and conscientious of Flemish painters.¹ The world of art and letters is under some debt to the father who thus constrained his son; for whether, if left to himself, Ruskin would ever have finished his greatest book at all, may well be doubted. His industry was prodigious, but it was equalled by his curiosity, and hence he lacked the habit of concentration. Moreover, his mind was at this time becoming increasingly absorbed in quite other questions than those which were immediately involved in the concluding parts of *Modern Painters*. One sees what was to come in several passages in this volume. Thus, in discussing the effect upon the human mind of beauty in art, he refers to the unsettlement of his convictions, and to his doubts of "the just limits of the hope in which he may permit himself to continue to labour in any course of Art."² And so, again, his discussions of painters and pictures were, he tells us, "continually altered in shape, and even warped and broken, by digressions respecting social questions, which had for me an interest tenfold greater than the work I had been forced into undertaking."³ At the end of the volume we see the transition towards economic questions in progress. He is ostensibly still discussing the choice of subjects and ideas in pictures; but the inquiry leads him to consider "the right economy of labour."⁴ In the summer which saw the publication of this fifth volume, the digressions established themselves as Ruskin's first pre-occupation. If it had not been for his father's pressure, Ruskin might have been caught in the maelstrom of economics before *Modern Painters* had been finished at all. The book may thus be said to be a monument of a double allegiance—of devotion to his master, Turner, and also of devotion to his father, of whose mingled

¹ The first words of the Flemish proverb are inscribed by Jan Van Eyck on his Portrait of a Man in the National Gallery (No. 222).

² Part ix. ch. xi. § 16 (p. 423).

³ Part ix. ch. i. § 7 (p. 257).

⁴ Part ix. ch. xi. § 22 (p. 427).

shrewdness, affection, and good sense the reader of the correspondence in this edition must already, I think, have received a strong impression. The force of the motive derived from the defence of Turner was by this time spent. Ruskin's advocacy had won the case, but had won it too late, for Turner had passed "beyond these voices." Nor was that all. It was a main object with Ruskin to teach that "all great art depended on nobleness of life." What he had gathered of Turner's life had not shaken his conviction; but it had suggested the difficulty of proving it in a case where the gold was so much mixed with the clay. "I knew his life had been noble," said Ruskin in after years, "but not in ways that I could convince others of, and it seemed to me that all my work had been in vain."¹ And there were other difficulties which beset the completion of his task. He describes them in his Preface; and we must take note of them here, for the discussion will serve to bring out some characteristics of the volume.

First, then, Ruskin had to resume threads which had been dropped for some time. It is not indeed to be supposed that the whole of this volume was composed during the winter of 1859-1860. We have already given reasons for thinking that some portions were written, in first draft, at the same time with the fourth volume.² And in the MS. of the first chapter Ruskin himself says that some of it was written "long ago."³ Other portions were written at Turin in 1858. "I get now," he says to his father, "a good many spare half-hours for thinking over *Modern Painters*, and sometimes doing a little, and hope soon to get into the run of it. It will be a finished, I hope *glowing* volume, but perhaps a little less sparkling than younger ones."⁴ Among the passages written at Turin were (as already said) the notes on various pictures and some of the studies of skies.⁵ But the whole material had to be sifted and rearranged; this process was laborious, and may well have been disheartening.

For the longer he had worked and studied the more conscious he became of the amount of work and study which remained to be done. The scheme of the treatise required him in this final volume to deal successively with Beauty of Water, Beauty of Vegetation, and Beauty of Sky. With Beauty of Mountains he had dealt in the preceding volume, and the subject had occupied him for 338 pages. And these discussions were only subdivisions of Ideas of Beauty; the whole subject of Ideas

⁴ Letter from Turin, July 27, 1858.

⁵ See below, pp. 168, 172.

of Relation remained to be treated also. Had the full scheme been carried out on the scale of the discussion of Mountain Beauty, there had been no counting of the volumes which should have been written. The first step was to throw some of the cargo overboard. "I cut away," he wrote to Dr. John Brown, "half of what I had written."¹ The proposed section on Sea Beauty was given up altogether, as Ruskin explains in the Preface. It appears from what he there says that he had much in his mind on the subject. All, however, that the editors have found among his papers are some rough jottings in one of his diaries of the proposed contents; these are here printed in an Appendix (p. 484). It should be remembered, however, that Ruskin had already thrown off in the form of an Introduction to *The Harbours of England* a singularly interesting essay on the painting of sea and ships.

Next, Ruskin found it impossible to deal as exhaustively as he had desired with Beauty of Vegetation. He had, indeed, for many years been a diligent botanist; understanding by the term botany the study of the aspects of flowers.² With their laws of growth he was not familiar; this was a new subject of inquiry, and with Ruskin to take up a new subject meant to turn upside down anybody else's treatment of it.³ "Many of the results" of his inquiry into "the origin of wood" could "only be given," he says, "if ever, in a detached form."⁴ Some of these results he gave in the year following the publication of the fifth volume in a lecture at the Royal Institution on "Tree Twigs." A report and abstract of this lecture are accordingly printed here in an Appendix (p. 467). The lecture on "Tree Twigs," though containing some further illustrations, corresponded in method and in spirit with the chapters in this volume. There was in it the same close study of natural aspects combined with poetical fancy, and the same imaginative connexion of those aspects with ideas of morality and mythology. The poetry of the leaf-aspects, as Ruskin draws it out in these chapters, might serve as a commentary on Shelley's lines:—

"No sister-flower would be forgiven
If it disdained its brother."

Ruskin, as Froude well remarks, had the gift of converting the minutest observations of natural phenomena into a poem.⁵ Very characteristic

³ See his letter to Mrs. Carlyle in Vol. V. p. 1.

⁴ See Preface, § 5; below, p. 7.

⁵ *Carlyle's Life in London*, 1885, vol. ii. p. 245, where also the following letter is printed.

of Ruskin is the division and subdivision of plants, with names for the categories which are themselves felicities of poetical observation—the division into (A) Tented Plants, so called because they pass as the tented Arab passes, leaving no memorial of themselves; and (B) Building Plants—builders because it is by the work of the leaves that the tree is built up; and then the subdivision, as of (B) into (*a*) Shield builders, and (*β*) Sword builders; according as the leaves resemble broad shields, or sharp swords. His method, at once discursive and comprehensive, was characteristically hit off by Carlyle, who had heard the lecture on “Tree Twigs”:—

“Friday last,” he wrote to his brother John (April 23, 1861), “I was persuaded—in fact had unwarily compelled myself, as it were—to a lecture of Ruskin’s at the Institution, Albemarle Street—lecture on Tree Leaves as physiological, pictorial, moral, symbolical objects. A crammed house, but tolerable to me even in the gallery. The lecture was thought to ‘break down,’ and indeed it quite did ‘*as a lecture*’; but only did from *embarras des richesses*—a rare case. Ruskin did blow asunder as by gunpowder explosions his leaf notions, which were manifold, curious, genial; and, in fact, I do not recollect to have heard in that place any neatest thing I liked so well as this chaotic one.”¹

Ruskin, it will be observed, leaves many questions open in his botanical chapters, and alludes sometimes to inquiries of which he had, as yet, learnt only the fringe.² For adequate statement of the present condition of botanical knowledge on questions left open by the author, the reader may be referred to recent works by Dr. Scott, F. Darwin, Professor Marshall Ward, and more especially to the English editions of Kerner’s *Natural History of Plants*, and of Professor Sachs’ treatises.³ Ruskin, as we know from remarks in his own copy of the fifth volume (annotated ten or more years later), would have revised some of its

¹ Another note on this lecture, though at second hand, is given in the *Letters of James Smetham* (p. 94): “I went,” he writes, “to Gilchrist’s on Saturday. Found him living next door to Carlyle, and to be an intimate friend of his. The day before he had gone with C. to hear Ruskin lecture at the Royal Institution. (Carlyle kept inquiring the time every ten minutes, and at last said, ‘I think he ought to give over now.’) Ruskin is a favourite of his, or he would not have gone at all, for he hates art in reality; but R. sent him a ticket. Gilchrist and several others we heard of thought the lecture a failure; but C. would not add the weight of his opinion to this, whatever he might think.” Ruskin himself speaks of the failure as “gnawing” him (see a letter cited in the Introduction to Vol. XVII.).

² See below, part vi. ch. ii. § 4 and *n.*; part vi. ch. vi. § 3 *n.*; and § 5 *n.* (pp. 22, 59, 61). For his interest at a later date in researches into the nature of the colouring matter of leaves and flowers, see *Time and Tide*, § 165.

³ For instance, D. H. Scott: *Introduction to Structural Botany*, 1894. F. Darwin and E. H. Acton: *Practical Physiology of Plants*, 1895. Harry Marshall Ward: *The Oak: a Popular Introduction to Forest Botany*, 1892. Anton Kerner von Marilann: *The Natural History of Plants*, translated by F. W. Oliver, 1894–1895. J. Sachs: *Text-book of Botany*, 1882; and *Lectures on the Physiology of Plants*, 1887.

passages in the light of subsequent researches.¹ He had intended, as we have seen, to reissue the chapters on Trees in a revised form, corresponding to *In Montibus Sanctis* and *Cæli Enarrant*; but this scheme was put aside.² His later studies in botany were the subject of a separate work—*Proserpina*—which unhappily remains a fragment.

With the next subject of his inquiry—"Of Cloud Beauty"—Ruskin was entirely at home. These Introductions have already shown how long and careful and minute had been his study of the clouds.³ But here, too, the more he knew the more he became conscious of the depth of the unknown. Looking back upon his work some years later he said that *Modern Painters* was "a mere sketch of intention, in analysis of the forms of cloud and wave": there were not enough scientific data, he said, to render the analysis complete.⁴ The note of diffidence which makes itself heard in this volume was finely commented upon by one of its most sympathetic readers at the time:—

"Such a sky! (writes Smetham, August 24, 1861). Such films and threads of infinite tenuity! Such flat roofs of cirri, lying high up in perspective, beyond the reach of science! Ruskin's 'don't know' in the last volume about clouds is very manly and noble after his spouterism in the first volume of *Modern Painters* on the same subject. There he spoke as if he had 'entered into the Springs of the Sea'; 'walked in search of the Depth'; 'seen the treasures of the Snow, the treasures of the Hail,' and 'by which way the light is parted,' and 'the way for the lightning of thunder,' and knew whether the 'rain had a father, and who had begotten the drops of dew and had numbered the clouds of heaven' I love him more for the subdued, reverential, renunciatory tone of his last writings, which come not from less knowledge but more wisdom."⁵

Ruskin notes the change of temper himself. The reader is now to find him, "though dogmatic (it is said) upon some occasions, anything rather than dogmatic respecting clouds." "I have learned," he says again, "during the sixteen years to say little where I said much, and to see difficulties where I saw none." "This," he says of another passage, "is a fifth-volume passage, and so worth something."⁶ Again, under the head of clouds, Ruskin did not get all done that he had intended.

¹ See on this subject a letter to C. E. Norton of June 2, 1861, reprinted in a later volume of this edition.

³ See, for instance, Vol. I. pp. xxx.-xxxi., and Vol. III. pp. xxv.-xxvii.

⁴ *Eagle's Nest*, § 129. The following sections (130-132) should also be compared with the Cloud studies in this volume.

⁵ *Letters of James Smetham*, 1891, p. 97. Smetham's quotations are from the book of Job (ch. xxxviii.), so often quoted by Ruskin. For Smetham, see Vol. XIV. pp. 460 seq.

⁶ See below, pp. 144, 163, 134 n.

"I may, perhaps, some day," he says, "systematise and publish my studies of clouds separately."¹ The studies were to be accompanied by numerous illustrations, for which his sketch-books and diaries would have afforded abundant material. This plan was not carried out; though it would perhaps have been in some measure fulfilled, if his health had allowed him to continue the publication of *Cæli Enarrant*—a collection of passages dealing with the clouds, of which only one part appeared (1885). A second part was, however, prepared; corrections and additional matter, bearing upon the present volume, are in this edition supplied from the printed chapter and the unpublished sequel of that work. In connexion with it Ruskin had been in correspondence with Sir Oliver Lodge, who sent a letter which Ruskin prepared for publication as a postscript to one of the chapters. This, in accordance with Ruskin's intention and by permission of the writer, is now included at the place indicated in Ruskin's proof-sheets of *Cæli Enarrant* (see p. 141). Ruskin refers in it to the new light which Sir Oliver Lodge's summary of scientific knowledge on the causes of cloud-motions threw upon his own inquiries, and looks forward to revising his chapters accordingly. That was not to be; and the fact should be borne in mind by readers of these chapters as they stand. Ruskin leaves open many questions which, had he been able to complete his revision, he might have treated differently. Just when his pen had to be laid aside, Ruskin felt that he was beginning to learn. "This has been a very bright day to me," he wrote to Miss Kate Greenaway on June 26, 1885. "I've found out why clouds float, for one thing!!! and think what a big thing that is." And again, on June 29:—

"Clouds are warmer and colder according to the general temperature of the air, but always enable the sun to warm the air within them in the fine weather, when they float high. I have yet to learn all about the wet weather on this new condition myself."

At about the same time that he was preparing *Cæli Enarrant*, Ruskin gave two lectures at the London Institution on skies and clouds. These—entitled *The Storm-Cloud of the Nineteenth Century*—are reserved for publication in a later volume; but references to passages in which *Modern Painters* was cited are here supplied in footnotes.

The Part in this volume treating "Of Cloud Beauty" introduces us to a new note in Ruskin's work, which was henceforth often to recur. In connexion with his cloud-studies, and also with the mythological interest which was strongly shown in many of Turner's pictures, Ruskin

¹ See below, p. 169 n.

was led to the examination of Greek myths. Their physical and their moral significance alike attracted him; and the studies, commenced in this volume, were afterwards continued in *The Queen of the Air*, as well as in some minor essays. A glance at the titles which he gave to Plates in this volume will show at once the fascination which the subject had for him—the rain-clouds became “The Graiæ,” the storm-clouds “Medusa” or “The Locks of Typhon”; the fading splendour of Giorgione’s fresco, “The Hesperid Æglé.” There will be more to say on this subject when we come to what Ruskin called his “Myth Book”;¹ but here we may note from his diaries how constant during these years of preparation for the present volume had been his classical studies. The *Clouds* of Aristophanes had long been a favourite play.² During the summer of 1858 he read “three or four times over in two months” the *Plutus*—a reading which was suggestive in many ways.³ But meanwhile it gave him, he says, “disgust with himself, for not knowing Greek enough to translate it.”⁴ This is a piece of self-depreciation which need not be taken too literally; for his diary shows that he studied the play deeply, analysing its characters, discussing its purpose, and collecting from it passages illustrative of Greek life and thought. He read the classics in this way constantly, and few English authors show a more familiar knowledge of them. In the present volume we may note the beginning of that minute study of words which he carried forward in *Munera Pulveris* and elsewhere. In plunging into the perilous sea of etymological derivation, perhaps with inadequate equipment, fancy, or *prima facie* impressions, sometimes led him astray.⁵ But, though he troubled himself with little *apparatus classicus*, he read his books over and over again, and noted carefully any allusion, suggestion, or usage which fitted in with his own line of thought. Of commentaries on the classics he made very little use, and (during the Continental journeys on which much of his work was done) even an adequate supply of the harmless, necessary dictionaries he had not always at hand; his work was all done for himself; and he

¹ See below, p. 184 n.

³ See, for instance, *Unto this Last*, § 65 n., and the title-page of *The Crown of Wild Olive*.

⁴ *Præterita*, iii. ch. i. § 22.

⁵ Thus in this volume the connexion between *fides* and *fio*, on which he founds an argument (see p. 213, and compare p. 326), can hardly be sustained. The suggested connexion of *Muse* and *Mother* is another case in point (p. 215). It should be remembered that at the time of Ruskin’s writing there was in this country little general knowledge of the results and methods of Comparative Philology: Peile’s *Introduction to Greek and Latin Etymology* was only published in 1869.

had made much study, before writing this volume, of Euripides and Sophocles and Aristophanes, of Homer, Hesiod, and Pindar, of Plato and Lucian. In Euripides, in particular, he found (he says) the essence of Greek tragedy.¹ In his interpretation of Greek myths, Ruskin's fancy perhaps carried him further than many scholars will care to follow. But, after all, it requires a poet to interpret a poet. The Greek poets refined upon the popular mythology, as each one's imagination led him; and Ruskin, who studied nature with the eye of an artist and the heart of a poet, was well equipped for interpreting these poetical refinements. The study of nature may be a better preparation than mere poring over texts for reaching the heart of nature-poets, and Ruskin claimed, not without justification, that he had the eye to see "what Homer and Pindar saw."²

The next Part in the volume—that which deals with "Invention Formal," or, in more common parlance, with Artistic Composition—though it contains some of the most acute of Ruskin's analyses of Turner's work, is hardly on the same scale of thoroughness as other parts of the work. Here, again, the author seems to have been in some measure oppressed by his subject. He had sometimes been supposed to slight the quality of composition in pictures; it was, he says, on the contrary the quality which, above all others, gave him delight;³ but the more he studied it, the more difficult of exposition did it turn out to be. When he began the volume it is clear that he meant the section on Composition to be much fuller than it ultimately became. Thus in one of the chapters on Vegetation (p. 128) he introduces Plates from Turner's "Richmond," as it were incidentally, remarking that what he has "chiefly to say of them belongs to our section on Composition;" but such principal discussion did not get itself said. When he came to the place (p. 228) he finds that the subject is too large, and in part hardly susceptible of analysis except by the method of actual copying of the works of great composers. But here, too, his habit of dispersing himself over various books must be remembered. He had already dealt with the subject of composition—very methodically and suggestively, if incompletely—in *The Elements of Drawing*. The student of Ruskin should, therefore, read together those pages and these on the same subject here. Among the inquiries which, under the head of "Invention Formal," Ruskin had intended to take up was that of "the effects of colour-masses in juxtaposition;"⁴

¹ See part ix. ch. ii. § 15 (p. 273 n.).

² *The Storm-Cloud of the Nineteenth Century*, 1884, p. 119.

³ See below, part viii. ch. i. § 2 (p. 204).

⁴ See his statement in the paper entitled "The Black Arts," Vol. XIV. p. 362.

but this also he put aside: the subject proved difficult, and its treatment would have delayed the appearance, and increased the bulk, of the volume. In this section of the work, as in those preceding it, Ruskin had intended to make considerable revision. An interesting scheme of rearrangement, which he had mapped out, is now given in an Appendix (p. 486).

The last Part of the volume deals with "Invention Spiritual"; that is to say, with those "Ideas of Relation" which pictures may convey by their "choice of subject and the mode and order of its history." The subject is endless; and Ruskin said, in after years, that though he had finished *Modern Painters*, it had no conclusion.¹ It is clear that here, also, he largely curtailed his original scheme. Thus towards the beginning of the volume (p. 119) he promises a discussion of Sublimity among other "Ideas of Relation"; but this intention was only in part carried out. Some additional passages on the subject, preserved by Ruskin, as "important," among his MSS., are now given in an Appendix (p. 481). But these final chapters contain, nevertheless, as they stand, much that is the most instructive in all his criticism, whether of art or of life; much also that is finest in expression. The chapters (part ix. ch. ii. to ch. ix.), in which he traces the outlook of men in successive ages upon problems of death and destiny, are more than a history of "ideas of relation" in art—full of suggestion though they are from this point of view; they are also, as a reviewer said at the time of their first appearance, "a splendid rhapsody on human progress."² What Ruskin said of the volume, in the letter already quoted—that it would be "glowing" if "perhaps a little less sparkling"—is here pre-eminently true; and the altered note marks the transition to Ruskin's later style—a style which has been characterised by Professor Norton; the diction is "simpler, less elaborate, for the most part less self-conscious;" the "purple patches" are less frequent, but "its whole substance is crimsoned with the passionate feeling that courses through the eager and animated words."³ The sentences tend to become shorter;⁴ the argument is more concentrated; the points are closer packed; and the images or allusions are

¹ See, again, "Readings in *Modern Painters*"; and compare what he says on p. 441, below.

² "Shirley" in *Fraser's Magazine*, December 1860, p. 729.

³ Introductions to the American ("Brantwood") editions of *Val d'Arno* and *Sesame and Lilies*.

⁴ The descriptions of Venice (part ix. ch. ix. § 1) may be cited as instances of compression; as this: "Fearless, faithful, patient, impenetrable, implacable,—every word a fate—sate her senate." Or this, for a picture in a short sentence: "Ethereal strength of Alps, dreamlike, vanishing in high procession beyond the Torcellan shore; blue islands of Paduan hills, poised in the golden west."

brought from a wider range and charged fuller with meaning; the epithets are less frequent, but each of them throbs with intensity.

The publication of this fifth volume concluding the work attracted very general attention in the press, and called forth a chorus of congratulation, the more noticeable by contrast with the chorus of condemnation which was to greet the author's next appearance in the literary arena. "From 1845 to 1860," he said afterwards, "I went on with more or less of public applause; and then in 1860 people saw a change come over me which they highly disapproved, and I went on from 1860 to 1875 under the weight of continually increasing public recusancy and reprobation."¹ In 1860 Ruskin's reputation, if the voice of the public organs of opinion were the test, stood probably at its highest point. "No author of our day," wrote a reviewer of the time, "has at once excited more admiration, and yet been assailed with more vehement censure than John Ruskin."² But by this time he had conquered most of his assailants.³ "He has outlived," wrote another critic, "and outwritten the obloquy and abuse that once assailed him; and while yet in the prime of life has attained the proud position of one of the greatest of all writers, living or dead, on the subject of art."⁴ Of the main purpose of the book—the defence of Turner—it was said afterwards by a distinguished critic that it was "the most triumphant vindication of the kind ever published;"⁵ and now that the treatise was at last finished, and its full scope revealed, the grandeur of the task was appreciated. The general verdict was expressed by a literary journal which had published much bitter depreciation of the author's earlier volumes. "Our duty is," said the *Athenæum*, "to report that the work is well, admirably, and nobly done. In method, single, clear, and as a whole eloquent to a marvel, as the world knows; and taken in the mass, these five volumes contain the most valuable contributions to art-literature the language can show." It was a work, wrote another critic (not hitherto favourable), not only of criticism, but of poetical creation. "Several poems in this closing volume," said "Shirley," "are

¹ See again "Readings in *Modern Painters*."

² *The Christian Observer*, September 1862, vol. 62, pp. 658-678: an article on "John Ruskin as a Religious Writer," being a review of *Modern Painters* and his other works.

³ *Blackwood's Magazine* was an exception. In an article signed "Peregrine" and entitled "A Day at Antwerp: Rubens and Ruskin" (September 1861, vol. 90, pp. 365-372), the fifth volume was noticed, and opportunity was taken to introduce a coarse personal attack upon the author. The reviewer was apparently proud of his bad taste, for the article was reprinted in 1874 (*Paradoxes and Puzzles*, by John Paget, pp. 437-449).

⁴ *The Eclectic Review*, November 1860, N.S., vol. 4, pp. 478-488.

⁵ Sir Leslie Stephen in the *National Review*, April 1900.

superb. There is a grand song about the Pine, such as some grey-beard bard in the Halls of Horsa might have sung; a glorious Greek hymn of Death and Resurrection; idylls about the leaves and the lichen and the mosses; an ode to Venice, blue and vivid as its own sea and sky. The very titles to the chapters are chosen by a poet." Various instances were given; and "here," said "Shirley" in conclusion, "we close our criticisms; and here (there having been strife between us) we must record our conviction that Mr. Ruskin has completed a book which is destined to live, and that this, its closing volume, is its flower and crown."¹

¹ *Fraser's Magazine*, December 1860, vol. 62, pp. 719-734 ("Mr. Ruskin at the Seaside: a Vacation Medley," by "Shirley" (John Skelton). In addition to those mentioned above, Reviews appeared in the *Dial*, June 22 and 29, 1860; the *Athenæum*, June 23 and 30; the *Leader*, June 30; the *Literary Gazette*, July 7; *Weldon's Register*, August 1860; the *Patriot*, August 2; the *Critic*, August 4 and 11, and September 1; the *Morning Post*, August 9; the *Spectator*, August 11 and September 1; the *Press*, August 18 and 25; the *Builder*, August 25; the *Weekly Mail*, August 25; the *Montrose Standard*, September 7; the *Saturday Review*, September 1 and 8; the *Witness*, September 12 and 19; the *Sun*, September 17; the *Illustrated London News*, September 29 and October 13 (hostile); the *London Review*, October 1860 (vol. 15, pp. 63-111); the *British Quarterly Review*, October 1860 (vol. 32, pp. 412-439); the *Methodist Quarterly Review*, October 1860 (New York: vol. 42, pp. 533-554—review by the Rev. Gilbert Haven); the *Eclectic Review*, November 1860 (vol. 92, pp. 478-488); the *Scottish Review*, January 1861 (No. 33, pp. 1-16); the *Christian Examiner*, January 1861 (Boston: vol. 70, pp. 29-48—an article headed "The Place of 'Modern Painters' in Art-Literature" (enthusiastic); the *Boston Review* (U.S.A.), July 1861, vol. i. pp. 323-338 (enthusiastic); and vol. ii. pp. 491-512 ("Ruskin's Literary Spirit"); the *Dublin University Magazine*, June 1861, vol. 57, pp. 687-695 ("Modern Pre-Raphaelitism"—hostile); the *North British Review*, February 1862, vol. 36, pp. 1-36 ("The Writings of Mr. Ruskin"). This last review was reprinted, with some omissions, in *Essays and Reviews*, by H. H. Lancaster, with prefatory notice by B. Jowett, 1876, pp. 297-350. (The writer incidentally censured the "buffoonery" of *Blackwood*, "which would be thought vulgar in a barrack-yard.") Mention may also be made of the *Weekly Review*, November 29, 1862, in which appeared "Venice in the time of Giorgione and Titian: versified from a passage in *Modern Painters*, Vol. V." Signed "Ellis V." (One stanza may be quoted, if only to show how poetry may sometimes be marred by rhyme:—

"He went down to the marble city; there
The fiery heart of its great life to be.
A marble city, said I? Frankly dare
A golden city to proclaim; the sea
Flowed in its smooth streets, pulsing tenderly,
In liquid emerald; its turrets threw
The gleam of gold or jasper far and free,
While, from beyond, the circling ocean blue
Still, to and fro, its green waves eddying drew."

Some of the Reviews of Thornbury's *Life of Turner* also noticed Ruskin's fifth volume; for instance, the *Quarterly Review*, April 1862, vol. iii. pp. 450-482 (an extract from this article is given below, p. 445 n.); and the *Westminster Review*, April 1862, N.S., vol. 21, pp. 417-445. An article in the same review on "The Critical Character" (October 1863, N.S., vol. 24, pp. 468-482) noticed books by Ruskin and Matthew Arnold.

The book was destined to live, and to live more widely as years went on. In America, as already noted, Ruskin was from the first largely read. The cheap, pirated editions which were promptly issued in the United States, introduced him to a wider circle than the luxurious and expensive volumes could reach at first hand in his own country. On the Continent, too, his work began to attract attention. In the *Revue des Deux Mondes* Monsieur Joseph Milsand, a friend of Robert Browning, celebrated the completion of *Modern Painters* by an elaborate examination of Ruskin's æsthetic theories, and this "study" was presently republished in book form;¹ but it was not till a later date, as will be noticed in a later volume, that the cult of Ruskin obtained any considerable vogue in France. His vogue in Germany, now very extensive, was also of later growth.

The history of the later English editions of *Modern Painters* has already been told;² of this fifth volume no second edition appeared until 1873, when it formed part of the re-issue of the whole work. Another re-issue, again of the whole work, appeared in 1888; and for that issue Ruskin wrote the Epilogue here included (p. 461). The biographical particulars belong to a much later volume. It may here be stated briefly that Ruskin's health had failed again in the summer of 1887, and he left Brantwood for Folkestone in the August of that year. Thence he moved to Sandgate, and was there—on and off—till June 1888, when he went abroad, first by Boulogne to Abbeville, with Mr. Arthur Severn (June 10), and then on into Switzerland. Early in September he was at St. Cergues and Sallanches, and on September 15 reached Chamouni once more after an absence of fourteen years (1874). On September 16 he there writes in his diary:—

"Have just written the last clause to the Epilogue to *Modern Painters* in the perfected light of Mont Blanc, after being at mass and a little walk on fresh grass towards Source of Arveron."

The Epilogue, it will be seen, restates emphatically the fundamental consistency of the main aim and principle of *Modern Painters*.

The *text* of the Fifth Volume of *Modern Painters* shows few variations of any importance between different editions. It was not revised

¹ See the article entitled "De l'influence littéraire dans les beaux-arts," in the *Revue* for August 15, 1861 (vol. 34, pp. 370-915). Milsand had contributed a previous article ("Une nouvelle théorie de l'art en Angleterre"), dealing mainly with Ruskin's architectural theories, to the *Revue* of July 1, 1860. These articles were revised and republished in 1864 under the title "L'Esthétique Anglaise. Étude sur M. John Ruskin. Par J. Milsand"; Paris: Germer Baillière, Libraire-Éditeur, etc., 1864.

² Vol. III. pp. xlvii.-1.

by the author either for the collected edition of 1873 or for that of 1888. In one of his own copies he had, however, marked a few alterations; and he made others in reprinting chapter i. of part vii. in *Cæli Enarrant* (and see above, p. lxi.). In that work, as also in *Fronde Agrestes*, he added a few notes. These are here given below the text. References to *Fronde* are only given where such notes occur; a general collation of the passages included in that volume having been already supplied (Vol. III. p. lxi.).

The editors have also had access to another of Ruskin's copies of the book (given by him to Arthur Burgess, and now in possession of Mr. Hugh Allen), in which he had marked out a partial scheme of rearrangement.

The contents of the *Appendix* added in this edition of the volume have already been mentioned. Appendix I. contains a report of Ruskin's Lecture on Tree Twigs, above referred to, p. lix.; Appendix II. gives additional passages from the MS. (see above, pp. lviii., lxiv.); Appendix III., the author's proposed rearrangement just mentioned; and Appendix IV., the "Notes on German Galleries" (see above, p. l.). The *Index* to the original edition was made under Miss Bell's superintendence by the girls at her school at Winnington, unhelpt by the author.¹ Mr. Wedderburn's index, substituted in the edition of 1888, is reserved for incorporation in the General Index volume.

The *manuscript* of the Fifth Volume is in the possession of Mr. Pierpont Morgan (formerly in that of Mr. Allen). It is written on the author's usual foolscap. The MS. of chapter ii. part viii. ("The Task of the Least") is missing, as also that of part ix. chapter xii. §§ 1-4. The MS. shows that the author rewrote and revised as carefully as in other volumes. *Facsimiles* of two pages are given (pp. 374, 458), and a few instances of the author's revisions are supplied in footnotes (see, *e.g.*, pp. 15, 19, 65, 134, 257, 281). There are also among the Pierpont Morgan MSS. several loose sheets of matter apparently intended for this volume; some of this is printed in the Appendix (p. 479). The MS. of the Epilogue was never in Mr. Allen's hands.

The *illustrations* prepared by Ruskin for the volume were elaborate, and caused him, as he explains, much work and anxiety. Of the 34 engraved Plates which were given in the original edition, 16 were from Ruskin's own drawings, 4 others from his drawings after Turner or other masters, while three of the Plates were etched by the author himself. But he had prepared many other Plates which, for one reason

¹ So stated by Ruskin in a letter to Sir J. Nasmyth, April 5, 1861.

or another, were held over.¹ The trouble he took with the preparation of the Plates has been described in another volume;² to the skill and patience put into the work by Armytage, Cuff, and Cousen he pays a tribute in the Preface. Le Keux's work had been already highly commended.³ Other Plates were engraved by Mr. J. Emslie—a student under Ruskin at the Working Men's College, who has contributed to a recent publication some interesting reminiscences of Ruskin's classes.⁴ In the edition of 1873 the original Plates were again used. When the work was again issued in 1888, five of the Plates having become much worn or having been destroyed, the subjects were re-engraved by Mr. G. Cook (see Vol. III. p. lx.). In that edition three additional Plates were inserted, which have been reproduced in all subsequent editions—Nos. 85, 86, and 87. These were etchings by Ruskin⁵ (afterwards mezzotinted by Lupton) from Turner's drawings. Ruskin made the etchings in 1859, and the Plates were intended for the volume; but there was some delay in the preparation of them, and they were held over (as Mr. Allen remembers) in consequence of the anxiety of Ruskin's father to see the work out of hand. Some copies of the three engravings were printed shortly after the publication of the volume, and were issued, by Ruskin's permission, to a few friends and others specially interested in the work. These three Plates may be included among the illustrations which Ruskin mentions as being held over; but he had also schemes on hand, as we have already seen,⁶ for reproducing many of Turner's drawings on a larger scale (p. 56). Among his schemes for the future was another tour in Turner's footsteps, "to take such record of his best-beloved places as may fully interpret the designs he left" (p. 436 *n.*); but this and many another scheme were to be drowned in other tasks.

In addition to the numerous engravings on steel, the Fifth Volume included 101 woodcuts; many of these are (as in previous editions⁷)

¹ See below, Preface, § 6, p. 8; and a letter to Dr. John Brown cited in the Introduction to Vol. XVII.

² Vol. IX. pp. l., li.

³ See Vol. V. pp. lxii., 10.

⁴ *The Working Men's College, 1854-1904*, edited by J. Ll. Davies, 1904, pp. 39-53.

⁵ The catalogue of the Ruskin Exhibition at Manchester, 1904, contained the following item:—

"535. The etching-needle contrived for Ruskin in order to make six strokes at once, but discarded by him as being too mechanical, though used for the mountains in his etching of Turner's 'Lake of Zug,' *Modern Painters*, vol. v. edition of 1888" [Plate 87].

⁶ See Vol. XIII. p. lix. Some further notice of the scheme will be found in the Introduction to Vol. XVII., dealing with Ruskin's sojourn at Morne, during which he took up the work for a while.

⁷ In the small editions of the work this was not the case: see Bibliographical Note, p. lxxiii.

printed separately from the text, as being of considerable elaboration. Here, again, many more were prepared than were ultimately embodied in the volume. Thus Miss Byfield prepared three separate wood-engravings, which were not used—two after woodcuts by Dürer, one after a picture by Titian.¹

In the present edition all the original woodcuts have been employed. In the case, however, of the Plates, the necessity of reduction, owing to the size of the page, or the defective state of the original steels, has, in most cases, necessitated the process of reproduction by photogravure. Particulars of these matters are given in a note to the List of Illustrations (p. xviii.).

Seven additional Plates are introduced in this edition. Three of them are placed in this Introduction, being reproductions of drawings made by Ruskin during the years when the volume was in preparation.

Plate A is a photogravure of the drawing of rocks at Killiecrankie (1857), already mentioned (p. xxvi.). The drawing, which is in water-colours ($11 \times 9\frac{1}{2}$), is at Herne Hill.

Plate B is a chromo-lithograph from a drawing of Rheinfelden (1858): see above, p. xxix. It is in water-colours ($16\frac{1}{2} \times 13$), and is in Mr. Allen's possession.

Plate C is a photogravure of two sketches of the Castle of Schwytz at Bellinzona (1858): see above, p. xxxv. The sketches, which are in water-colours (each $5\frac{3}{4} \times 8\frac{1}{4}$), are at Brantwood.

The four other Plates are reproductions of works described by Ruskin in the text. Plate D ("The Knight and Death") and Plate E ("Melencolia") will enable the reader to follow more easily Ruskin's interpretations of Dürer's designs, and will be useful for reference in later volumes where he again discusses the same Plates, while Plate G shows the equestrian portrait by Vandyck in the Turin Gallery, which is one of the pictures most fully described by Ruskin in the present volume (pp. 358–361 *nn.*). Plate F is from Ruskin's copy of a portion of the Family Group by Paolo Veronese, already mentioned (p. l.). The copy, which is in pen and ink ($10\frac{3}{4} \times 13$), is at Brantwood.

E. T. C.

¹ *Bibliography of Ruskin*, by Wise and Smart, vol. ii. p. 33. Ruskin gave these engraved blocks to Arthur Burgess, and they are now in the possession of Mr. Hugh Allen.

(This volume is followed in the chronological order by Vol. XVII. The Introduction to that volume should therefore be read next.)

[*Bibliographical Note.*—Of this volume in a separate form there was only one edition (though of this there were two issues), published in 1860, with the following title-page:—

Modern Painters | Volume V. | Completing the work, and containing |
Parts | VI. Of Leaf Beauty.—VII. Of Cloud Beauty. | VIII. Of Ideas
of Relation. | 1. Of Invention Formal. | IX. Of Ideas of Relation. | 2.
Of Invention Spiritual. | By John Ruskin, M.A., | Author of “The
Stones of Venice,” “Seven Lamps of Architecture,” | etc. etc. |
[*quotation from Wordsworth, as in vols. i., ii., iii., and iv.*] | London : |
Smith, Elder & Co., 65 Cornhill. | 1860. | [*The Author reserves the
Right of Translation.*]

Imperial 8vo, pp. xvi. + 384. The Preface occupied pp. v.–xii.; Contents, pp. xiii.–xiv.; List of Engravings on Steel, p. xv.; List of “Separate Engravings on Wood,” and “Errata,” p. xvi.; Text, pp. 1–357; Indices, pp. 359–384. The imprint at the foot of the last page (and at the foot of the reverse of the half-title) is “London: Printed by Smith, Elder & Co., Little Green Arbour Court, Old Bailey, E.C.” Issued on June 14, 1860, in green cloth boards, uniform with volumes iii. and iv. Price 50s. The price of the complete work in its original form was thus £8, 0s. 6d.

The first issue of all contained, as the list of “Errata” mentioned above, two items only, thus:—

p. 13, line 9 from bottom, omit the words “Fig. 1.”

p. 123, line 17 from top, for “opposite,” read “facing p. 343.”

This issue contains a variation on p. x. (here p. 8 *n.*). In the footnote it reads, “Aid, just as disinterested, . . . has been given me . . . ; and by Mr. Robin Allen, in accurate line studies from nature. . . .” The helper really referred to was Mr. George Allen; and Ruskin’s father, when the mistake was discovered, cancelled the sheet in order that it might be corrected at once. In the later copies, therefore, “Mr. G. Allen” was substituted for “Mr. Robin Allen”; the mistake no doubt arose through the help given to Ruskin in another matter by Mr. Robin Allen (see below, p. 311). Curiously, another mistake in the same note was not corrected (see below, p. lxxiii.); but some further items were added to the list of Errata, which, in the second issue, was as follows:—

p. 13, line 9 from bottom, omit the words “Fig. 1.”

p. 39, line 22 from top, for “simplest,” read “swiftest.”

p. 123, line 17 ,, for “opposite,” read “facing p. 343.”

p. 146, line 12 ,, for “conveyance” read “convergence.”

p. 161, line 25 ,, for “fired” read “hard.”

p. 216, in Greek couplet, for “*γῶον*” read “*πόον*.”

p. 264, line 15 from top, for “boating” read “boxing.”

The third of these errata explains a peculiarity in the Plates. Ruskin had first intended to insert the Plate in question, “Monte Rosa: Sunset,” at

No other edition of the volume was published until 1873, when the whole book was reissued. (For the bibliography of the complete work, and of selections from it, see Vol. III. pp. lviii.-lxii.) There was thus no second edition of the fifth volume in a separate form, as had been the case with the third and fourth volumes. Accordingly when the "New and Complete Edition" of 1888 was issued, 250 extra copies were printed of the fifth volume "in order to supply the wants of those whose sets are incomplete." The price of these copies was three guineas (reduced in July 1900 to 30s.).

List of Engravings on Steel.—In the 1888 edition there were the following alterations necessitated by various changes and additions: Plates 52 and 58, the engraver's name was changed from "R. P. Cuff" to "G. Cook"; Plates 68, 80, and 81, it was changed from "J. C. Arnytage" to "G. Cook"; Plates 73 and 74, the artist's name was changed from "J. M. W. Turner" to "J. Ruskin, from J. M. W. Turner," and the engraver's from "J. Ruskin" to "Boussod, Valadon, and Co." And Plates 85–87 were added as in the list here. The List, which in the two previous editions finished on a single page, was continued on the following one, which had previously contained the list of "Separate Engravings on Wood" only, as follows:—

This list in the 1888 edition followed the List of Engravings. The subjects of the woodcuts thus separately printed were not stated in any edition before the present. Also "Figures 75 to 78" were given as being printed on a separate page; this should have been "Figures 74 to 78." In the present

edition Figure 91 is also separately printed. In the small edition, the list of "Separate Engravings on Wood" disappeared; Nos. 58, 61, 85, 87, 88-90, 98, and 100, were separately printed; Nos. 74-77 were printed on a separate page, but No. 78 was printed in the text: this rearrangement necessitated some consequential alterations in the references to the figures in the text. In the small edition, the "List of Engravings on Steel" became "List of Plates to Vol. V."; for "Artists," as the heading, it read "Drawn by," and for "Engravers," "Reproduced from Engravings by." Plates 73 and 74 were now again attributed under those headings to "J. M. W. Turner" and "J. Ruskin" respectively. Owing to the reduction in size necessitated by the *format* of the small edition, the words "reduced in this edition" were added in footnotes at places where Ruskin referred for any reason to the size of his illustrations—viz. in his references to Figs. 56, 57, 58, 60, 61, 62, 94, 98, and Plates 57, 61, 80, 81.

Preface.—§ 1, line 16, "Dumblane" is here altered to "Dunblane"; § 5, line 8, "mathematicians" misprinted "mathematicains" in ed. 1; line 25, "lost" in all previous editions is here corrected to "cost" in accordance with Ruskin's copy for revision; § 6 *n.*, last line but one, eds. 1 and 1873 read "though only one is engraved"; there are, however, two (Plates 52 and 58); the correction was made in 1888.

Part vi.—*Ch. i.* § 2, line 8, "as" has been here inserted (omitted in all previous editions.)

Ch. iii. § 5, line 3, ed. 1 reads "Fig. 1" before "Plate 51."

Ch. v. § 6, line 16, "page 90" in all previous editions is here corrected to "96"; § 8, the reference here given in a footnote was supplied by Ruskin in the text, and was to the page of ed. 1; § 9, line 3, ed. 1 reads "simplest" for "swiftest."

Ch. vii. § 3, six lines from end, eds. 1 and 1873 read "all" before "its branches," and, four lines lower, "decent" for "gentle"; these two alterations were introduced in the 1888 edition from Ruskin's corrected copy.

Ch. viii. § 13, line 9, "Lefèvre" in all previous editions is here corrected to "Lefèbre"; § 13, at end, the reference here given in a footnote was supplied by the author in the text; § 18, line 24, "Here" was altered in the small editions to "Overleaf."

Ch. ix. § 9, lines 5-13, see p. 108 *n.*; § 14, last line, "Thurm" in all previous editions here corrected to "Thurn."

Ch. x., in the small editions some changes of reference were introduced in the text owing to the fact that Figs. 74-78 were not printed on one page but interspersed in the text; § 18, line 9, edition 1873 misprinted "aborescence."

Part vii.—*Ch. i.* § 2, lines 17, 18, "rises" and "descends" are here italicised in accordance with *Cæli Enarrant*; and so "perfect" in § 3, line 6; § 9 *n.*, in *Fronde Agrestes* (1875) the concluding paragraph of § 9 is the end of § 24, the author's footnote being there shortened to "Compare, in *Sartor Resartus*, the boy's watching from the garden wall": see also p. 141 *n.*

Ch. ii. § 1, line 8, "in" and "with" are here italicised in accordance with the author's proof for *Cæli Enarrant*; and so also the word "produced" in the last line of § 2; § 3, line 4, ed. 1873 misprinted "cirrous";

line 14, "always finely divided" here italicised (as above); and seven lines lower, "rain-cloud" is here quoted; § 6, line 1 "(Fig. 80)" is here inserted from Ruskin's proof for *Cœli Enarrant*; similarly, in line 16, "plighted" is italicised; § 6, author's note, line 1, "method" in all previous editions here altered to "methods"; § 6 n., line 15, "opposite page . . ." (a different page in different editions) is here altered to "opposite this page"; § 6 n., nine lines from end, the page reference (which has differed in successive editions)—"At page . . ."—is here altered to "In Fig. 66"; § 7, last line but one, the small edition misprints "trust" for "thrust"; § 8, line 4, see p. 151 n.; § 13, line 15, "Pools" is here corrected to "Pool"; § 17, line 19, ed. 1 reads "Opposite" for "Facing page"; the Plate, however, was not there inserted, but at p. 343 (in this edition, p. 441). In the edition of 1873 and later (that place being retained) the necessary alteration in the text here was made; § 19, line 18, ed. 1873 misprinted "Wovermans"; § 19, last line, the words "the next range in level below these" are added from Ruskin's proof for *Cœli Enarrant*.

Ch. iv. § 4, line 2, see p. 177 n.; § 15 *ad. fin.*, ed. 1 reads "conveyance" for "convergence"; § 16, line 6, "Slaver" (in all previous editions) is here corrected to "Slavers"; § 17, fourth line from end, see p. 189 n.

Part viii.—*Ch. i.* § 20, author's footnotes, wrong references (in all previous editions) to Plato are here corrected; from "Phaedo 66" to "Phaedo 28," and from "Phaedo 11" to "Phaedo 4."

Ch. iii. § 4, in the quotation from Michelet a few misprints in all previous editions have here been corrected.

Ch. iv. § 6, line 3, eds. 1 and 1873 read correctly "of parts"; all later editions hitherto, "or parts."

Part ix.—*Ch. ii.* § 9, line 6, see p. 267 n.; § 14 n., ed. 1873 misprinted "Hess." for "Hes."; § 19 n., ed. 1 reads "γόνον" for "νόον."

Ch. iii. § 10 n., the reference to Herodotus ("i. 59" in all previous editions) has here been corrected to "i. 159." Similarly the reference to *Hippias Major* has been corrected from 208 to 290 D.; § 33, line 15, "enchanter's," in ed. 1 and 1873, was in later editions incorrectly printed "enchanters'."

Ch. v. § 11, three lines from end. Possessors of other editions should note that Ruskin gave a wrong reference to Vol. II., viz. "p. 151" (of the original editions), which should have been "p. 144"; the wrong reference was given in all successive editions. The right reference is to pt. iii. sec. ii. ch. ii. § 4. § 12, line 2, all editions hitherto have misprinted "carrying" for "causing" (in the MS.); § 17, line 6, eds. 1 and 1873 read "incomparably."

Ch. vi. § 22, line 3, the small editions misprint "painter" for "painters"; line 29, ed. 1 reads "boating" for "boxing."

Ch. vii. § 6, line 11, ed. 1 reads correctly "royalest"; all later editions misprint "royalist."

Ch. viii. § 5, line 8, in eds. 1 and 1873 (and in the MS.) "Kishon"—an obvious slip of the pen for "Pison," which was substituted in the edition of 1888. Kishon—though the scene of two famous incidents, the

defeat of Sisera and the destruction of the prophets of Baal by Elijah—is but a small torrent or winter-stream in Palestine. Pison is the first river of Paradise (Genesis ii. 11), and it is of Paradise that Ruskin is here speaking. § 13, lines 19–30, this passage has hitherto been wrongly enclosed in quotation marks.

Ch. ix. § 1, line 11, in the reprint of this passage in *The Stones of Venice* (see here, p. 375 n.) “emeralds” was printed for “emerald,” and in line 30 the reprint read, “. . . ether, a world,” etc. These were not revisions by Ruskin, but the inaccuracies of a secretary who copied the passage for the press.

Ch. x. § 14, in the first line of the quotation from Cary’s *Dante* all previous editions read “backing”; Cary wrote “backening,” which word is here substituted.

Ch. xi. § 18, line 29, the chapter from this point, down to the end of it, was reprinted by Ruskin in his *Notes on his Drawings by Turner* (see Vol. XIII. p. 497). The passage there ran as follows: “Looking broadly, etc., . . . good for him” (§ 22). Then the footnote (here pp. 427–428) ran straight on in the text—“. . . good for him. I cannot repeat too often . . . for her mistress.” The main text then continued—. . . for her mistress. I believe an immense gain (§ 23) . . . *Miroir des Paysans*” (end of § 24). The footnote (here p. 430) then ran straight on—“. . . *Miroir des Paysans*. This last book . . . its close.” The main text then continued—. . . its close. How far this simple (§ 25) . . . vanity of human life” (§ 26). The footnote (here p. 431) then ran on in the text—. . . of human life. The Cumæan Sibyl, . . . known only by her voice” (the quotation marks and the terminal words “(See my notes on the Turner Gallery)” being omitted. The text then resumed with a passage adapted from *ch. x.* § 8, thus—. . . only by her voice. The Hesperid *Æglé* from whom this chapter is named, was the daughter of *Æsculapius*, by one of the daughters of the Sun. She is the healing power of Evening light. She is thus spoken of, with her three companions, Hesperids in the chapter on Turner’s Garden! Their names are, *Æglé*,—Brightness; *Erytheia*,—Blushing; *Hestia*,—the (spirit of the) Hearth; *Arethusa*,—the Ministering. O English reader! hast thou ever heard of these fair and true daughters of Sunset beyond the Mighty Sea?” § 26 is then resumed—. . . the mighty sea. He painted these . . . ‘but together’” (§ 30). The footnote (here pp. 434–435) is then given as a continuation of the main text—. . . ‘but together.’ Turner appears . . . would not tell me.” The text then continued (§ 30)—“The meaning of the entire . . . Minos and Rhadamanthus.” The footnote (here pp. 435–436) was then given in the main text, with some omissions referring to plates in *Modern Painters*, thus—. . . Minos and Rhadamanthus). I limit myself in this book . . . designs he left.” Breaking off the footnote at this point, the text continued—. . . designs he left. I need not trace (§ 31) . . . thread of Atropos.” The footnote (here pp. 437–439), again with some omissions, was then carried into the text, thus—. . . thread of Atropos. I have not followed out . . . Morgarten.” The main text was then resumed (§ 31)—“. . . Morgarten. I will only point out, in conclusion, . . . enchanted voice of Venice.”

In the reprint Ruskin introduced some italics and added some footnotes; these are indicated in footnotes under the text of this volume: see pp. 425, 426, 428, 435. § 31, author's note, the references to "Plate 86" and "Plate 87" were first introduced in the edition of 1888 (see above); § 32, author's note, some misprints (which have occurred in all previous editions) in the quotation from Zanetti are now corrected.

The *headlines* in all editions hitherto have been the title of the chapter, both on the left-hand and right-hand pages, with the number of the Part in the corner of the former, that of the chapter in the corner of the latter.]

MODERN PAINTERS

VOLUME V

PREFACE

1. THE disproportion between the length of time occupied in the preparation of this volume, and the slightness of apparent result, is so vexatious to me, and must seem so strange to the reader, that he will perhaps bear with my stating some of the matters which have employed or interrupted me between 1855 and 1860.¹ I needed rest after finishing the fourth volume, and did little in the following summer. The winter of 1856 was spent in writing the *Elements of Drawing*, for which I thought there was immediate need; and in examining with more attention than they deserved, some of the modern theories of political economy, to which there was necessarily reference in my addresses at Manchester. The Manchester Exhibition then gave me some work, chiefly in its magnificent Reynolds' constellation;² and thence I went on into Scotland, to look at Dunblane and Jedburgh, and some other favourite sites of Turner's;³ which I had not all seen, when I received notice from Mr. Wornum that he had obtained for me permission, from the Trustees of the National Gallery, to arrange, as I thought best, the Turner drawings belonging to the nation; on which I returned to London immediately.

¹ [For further account of Ruskin's work, summarised in this paragraph, the reader may consult the Introductions to Vol. XIII. (Turner); Vol. XIV. (*Academy Notes*); Vol. XV. (*Elements of Drawing*); and Vol. XVI. (Manchester addresses on *Political Economy of Art*, etc.).]

² [For another reference to the Manchester Art Treasures Exhibition of 1857, see Vol. XVI. p. 9. Nearly fifty pictures by Reynolds were in the Exhibition. They included a large number of portraits, and such famous pictures as "Robinetta" and "Mrs. Pelham feeding Chickens." One fruit of Ruskin's study was the paper on "Sir Joshua and Holbein" (*Cornhill Magazine*, March 1860), reprinted in a later volume of this edition.]

³ [For the tour in Scotland, see above, Introduction, pp. xxv.-xxvi.]

2. In seven tin boxes in the lower room of the National Gallery I found upwards of nineteen thousand pieces of paper, drawn upon by Turner in one way or another.¹ Many on both sides; some with four, five, or six subjects on each side (the pencil point digging spiritedly through from the foregrounds of the front into the tender pieces of sky on the back); some in chalk, which the touch of the finger would sweep away;* others in ink, rotted into holes; others (some splendid coloured drawings among them) long eaten away by damp and mildew, and falling into dust at the edges, in capes and bays of fragile decay; others worm-eaten, some mouse-eaten, many torn, half-way through; numbers doubled (quadrupled, I should say,) up into four, being Turner's favourite mode of packing for travelling; nearly all rudely flattened out from the bundles in which Turner had finally rolled them up and squeezed them into his drawers in Queen Anne Street. Dust of thirty years' accumulation, black, dense, and sooty, lay in the rents of the crushed and crumpled edges of these flattened bundles, looking like a jagged black frame, and producing altogether unexpected effects in brilliant portions of skies, whence an accidental or experimental finger mark of the first bundle-unfolder had swept it away.

About half, or rather more, of the entire number consisted of pencil sketches, in flat oblong pocket-books, dropping to pieces at the back, tearing laterally whenever opened, and every drawing rubbing itself into the one opposite. These first I paged with my own hand; then unbound; and laid every leaf separately in a clean sheet of perfectly smooth

* The best book of studies for his great shipwrecks contained about a quarter of a pound of chalk débris, black and white, broken off the crayons with which Turner had drawn furiously on both sides of the leaves; every leaf, with peculiar foresight, and consideration of difficulties to be met by future mounters, containing half of one subject on the front of it, and half of another on the back.

¹ [The MS. gives the precise number as 19,723; the official report gives it as 19,331 (see *Report of the Director of the National Gallery*, 1857, p. 38). For particulars of the work here described by Ruskin, compare Vol. XIII. pp. xxxi.-xxxix., 185-345.]

writing paper, so that it might receive no farther injury. Then, enclosing the contents and boards of each book (usually ninety-two leaves, more or less drawn on both sides, with two sketches on the boards at the beginning and end,) in a separate sealed packet, I returned it to its tin box. The loose sketches needed more trouble. The dust had first to be got off them; (from the chalk ones it could only be blown off;) then they had to be variously flattened; the torn ones to be laid down, the loveliest guarded, so as to prevent all future friction; and four hundred of the most characteristic framed and glazed, and cabinets constructed for them which would admit of their free use by the public. With two assistants,¹ I was at work all the autumn and winter of 1857, every day, all day long, and often far into the night.

3. The manual labour would not have hurt me; but the excitement involved in seeing unfolded the whole career of Turner's mind during his life,² joined with much sorrow at the state in which nearly all his most precious work had been left, and with great anxiety, and heavy sense of responsibility besides, were very trying; and I have never in my life felt so much exhausted as when I locked the last box, and gave the keys to Mr. Wornum, in May, 1858. Among the later coloured sketches, there was one magnificent series, which appeared to be of some towns along the course of the Rhine on the north of Switzerland. Knowing that these towns were peculiarly liable to be injured by modern railroad works, I thought I might rest myself by hunting down these Turner subjects, and sketching what I could of them, in order to illustrate his compositions.

As I expected, the subjects in question were all on or near that east and west reach of the Rhine between Constance and Basle. Most of them are of Rheinfelden, Säckingen, Lauffenburg, Schaffhausen, and the Swiss Baden.³

¹ [Mr. George Allen and Mr. William Ward.]

² [Compare Ruskin's letter to his father, cited in Vol. XIII. p. 555 n.]

³ [For Ruskin's notes on some of these drawings, written before he had identified the places, see Vol. XIII. pp. 221, 222.]

4. Having made what notes were possible to me of these subjects in the summer (one or two are used in this volume¹), I was crossing Lombardy in order to examine some points of the shepherd character in the Vaudois valleys, thinking to get my book finished next spring; when I unexpectedly found some good Paul Veroneses at Turin.² There were several questions respecting the real motives of Venetian work that still troubled me not a little, and which I had intended to work out in the Louvre; but seeing that Turin was a good place wherein to keep out of people's way, I settled there instead, and began with Veronese's Queen of Sheba;—when, with much consternation, but more delight, I found that I had never got to the roots of the moral power of the Venetians, and that they needed still another and a very stern course of study.³ There was nothing for it but to give up the book for that year. The winter was spent mainly in trying to get at the mind of Titian; not a light winter's task; of which the issue, being in many ways very unexpected to me (the reader will find it partly told towards the close of this volume⁴), necessitated my going in the spring to Berlin, to see Titian's portrait of Lavinia there, and to Dresden to see the Tribute Money, the elder Lavinia, and girl in white, with the flag fan. Another portrait, at Dresden, of a lady in a dress of rose and gold, by me unheard of before, and one of an admiral, at Munich, had like to have kept me in Germany all summer.⁵

¹ [On Rheinfelden, see below, pp. 436–437 *nn.*; on Lauffenburg, p. 223; on Schaffhausen, p. 221.]

² [Compare Vol. XVI. pp. xxxvii., 185; and see above, Introduction, p. xxxviii.]

³ [See the Introduction, above, pp. xxxix.–xli.]

⁴ [See Part ix. ch. iii.]

⁵ [For Titian's "Lavinias" at Berlin and Dresden respectively, see below, p. 117. The "girl in white with a flag fan" is also a portrait of the painter's daughter, Lavinia—as a bride, the fan in the form of a little flag being carried in Venice by newly betrothed brides (see Morelli's *Italian Masters in German Galleries*, 1883, p. 174). The portrait of "a lady in a dress of rose and gold" is also by Titian; see below, p. 490. The "portrait of an Admiral" at Munich, once attributed to Titian, is a life-size portrait of the Grand Admiral Luigi Grimani, standing; he has only one eye; he wears a long red mantle over his armour, and holds a staff in his right hand. The picture is ascribed in the catalogue of the Gallery to the "school of Tintoretto."]

5. Getting home at last, and having put myself to arrange materials of which it was not easy, after so much interruption, to recover the command;—which also were now not reducible to a single volume—two questions occurred in the outset, one in the section on vegetation, respecting the origin of wood; the other in the section on sea, respecting curves of waves; to neither of which, from botanists or mathematicians, any sufficient answer seemed obtainable.

In other respects also the section on the sea was wholly unsatisfactory to me: I knew little of ships, nothing of blue open water. Turner's pathetic interest in the sea, and his inexhaustible knowledge of shipping, deserved more complete and accurate illustration than was at all possible to me; and the mathematical difficulty lay at the beginning of all demonstration of facts. I determined to do this piece of work well, or not at all, and threw the proposed section out of this volume. If I ever am able to do what I want with it (and this is barely probable), it will be a separate book;¹ which on other accounts, I do not regret, since many persons might be interested in studies of the shipping of the old Nelson times, and of the sea-waves and sailor character of all times, who would not care to encumber themselves with five volumes of a work on Art.

The vegetation question had, however, at all cost, to be made out as best might be; and again cost me much time. Many of the results of this inquiry, also, can only be given, if ever, in a detached form.²

6. During these various discouragements, the preparation of the Plates could not go on prosperously. Drawing is difficult enough, undertaken in quietness: it is impossible to bring it to any point of fine rightness with half-applied energy.

Many experiments were made in hope of expressing

¹ [For a fragmentary outline of Ruskin's scheme, see below, Appendix II. 4, p. 484. No other MSS. dealing with this proposed portion of the work have been found among Ruskin's papers.]

² [An intention partially carried out many years later in *Proserpina*: see also the lecture on "Tree Twigs" in Appendix I.; below, p. 467.]

Turner's peculiar execution and touch by facsimile. They cost time, and strength, and, for the present, have failed; many elaborate drawings, made during the winter of 1858, having been at last thrown aside.¹ Some good may afterwards come of these; but certainly not by reduction to the size of the page of this book, for which, even of smaller subjects, I have not prepared the most interesting, for I do not wish the possession of any effective and valuable engravings from Turner to be contingent on the purchasing a book of mine.*

Feebly and faultfully, therefore, yet as well as I can do it under these discouragements, the book is at last done; respecting the general course of which, it will be kind and well if the reader will note these few points that follow.

7. The first volume was the expansion of a reply to a magazine article;² and was not begun because I then thought myself qualified to write a systematic treatise on Art; but because I at least knew, and knew it to be demonstrable, that Turner was right and true, and that his critics were wrong, false, and base. At that time I had seen much of nature, and had been several times in Italy, wintering once in Rome; but had chiefly delighted in northern art, beginning, when a mere boy, with Rubens and Rembrandt.

* To Mr. Armytage, Mr. Cuff, and Mr. Cousen, I have to express my sincere thanks for the patience, and my sincere admiration of the skill, with which they have helped me. Their patience, especially, has been put to severe trial by the rewardless toil required to produce facsimiles of drawings in which the slightness of subject could never attract any due notice to the excellence of workmanship.

Aid, just as disinterested, and deserving of as earnest acknowledgment, has been given me by Miss Byfield, in her faultless facsimiles of my careless sketches; by Miss O. Hill, who prepared the copies which I required from portions of the pictures of the old masters; and by Mr. G. Allen, in accurate line studies from nature, of which, though only two are engraved in this volume,³ many others have been most serviceable both to it and to me.

¹ [On this subject, see a letter to Dr. John Brown cited in the Introduction to Vol. XVII. ; and compare in this volume pp. 56, 128, 156-157, 204, 401 n.]

² [See Vol. III. pp. xviii., 635 *seq.*]

³ [Namely, Plates 52 and 58. For Armytage and Cuff, see Vol. IX. p. 1. John Cousen (1804-1880) was much employed by Turner. For Miss Byfield, see Vol. V. pp. lxii., 12; for Miss Octavia Hill, Vol. XV. p. 134 n.]

It was long before I got quit of a boy's veneration for Rubens' physical art-power; and the reader will, perhaps, on this ground forgive the strong expressions of admiration for Rubens, which, to my great regret, occur in the first volume.¹

Finding myself, however, engaged seriously in the essay, I went, before writing the second volume, to study in Italy; where the strong reaction from the influence of Rubens threw me at first too far under that of Angelico and Raphael; and, which was the worst harm that came of that Rubens influence, blinded me long to the deepest qualities of Venetian art; which, the reader may see by expressions occurring not only in the second, but even in the third and fourth volumes, I thought, however powerful, yet partly luxurious and sensual, until I was led into the final inquiries above related.

8. These oscillations of temper, and progressions of discovery, extending over a period of seventeen years, ought not to diminish the reader's confidence in the book. Let him be assured of this, that unless important changes are occurring in his opinions continually, all his life long, not one of those opinions can be on any questionable subject true. All true opinions are living, and show their life by being capable of nourishment; therefore of change. But their change is that of a tree—not of a cloud.

In the main aim and principle of the book, there is no variation, from its first syllable to its last. It declares the perfectness and eternal beauty of the work of God; and tests all work of man by concurrence with, or subjection to that. And it differs from most books, and has a chance

¹ [Ruskin's first visit to Italy was in 1833 (see Vol. I. p. xxix., and for his admiration of Rubens, Vol. II. pp. 351-352); his second, in 1835 (Vol. II. p. 395). For the winter in Rome (1841-1842), see Vol. III. pp. xx., xxi. For some of "the strong expressions of admiration for Rubens," see *ibid.*, pp. 124, 187, 276, 290. See also *Præterita*, ii. §§ 101, 104. The study in Italy preparatory to the second volume of *Modern Painters* is described in Vol. IV. pp. xxiv.-xxxix. For some of the passages referred to on Angelico and Raphael, and the Venetian School, see Vol. IV. pp. 321-322 (Angelico and Raphael), pp. 85-86, 195 (Venetian-); Vol. V. p. 93; Vol. VI. p. 432.]

of being in some respects better for the difference, in that it has not been written either for fame, or for money, or for conscience-sake, but of necessity.

It has not been written for praise. Had I wished to gain present reputation, by a little flattery adroitly used in some places, a sharp word or two withheld in others, and the substitution of verbiage generally for investigation, I could have made the circulation of these volumes tenfold what it has been in modern society. Had I wished for future fame I should have written one volume, not five. Also, it has not been written for money. In this wealth-producing country, seventeen years' labour could hardly have been invested with less chance of equivalent return.

Also, it has not been written for conscience-sake. I had no definite hope in writing it; still less any sense of its being required of me as a duty. It seems to me, and seemed always, probable, that I might have done much more good in some other way. But it has been written of necessity. I saw an injustice done, and tried to remedy it. I heard falsehood taught, and was compelled to deny it. Nothing else was possible to me. I knew not how little or how much might come of the business, or whether I was fit for it; but here was the lie full set in front of me, and there was no way round it, but only over it. So that, as the work changed like a tree, it was also rooted like a tree—not where it would, but where need was; on which, if any fruit grow such as you can like, you are welcome to gather it without thanks; and so far as it is poor or bitter, it will be your justice to refuse it without reviling.

PART VI
OF LEAF BEAUTY

CHAPTER I

THE EARTH-VEIL

§ 1. "To dress it and to keep it."

That, then, was to be our work. Alas! what work have we set ourselves upon instead! How have we ravaged the garden instead of kept it—feeding our war-horses with its flowers, and splintering its trees into spear-shafts!

"And at the East a flaming sword."¹

Is its flame quenchless? and are those gates that keep the way indeed passable no more? or is it not rather that we no more desire to enter? For what can we conceive of that first Eden which we might not yet win back, if we chose? It was a place full of flowers, we say. Well: the flowers are always striving to grow wherever we suffer them; and the fairer, the closer. There may, indeed, have been a Fall of Flowers, as a Fall of Man; but assuredly creatures such as we are can now fancy nothing lovelier than roses and lilies, which would grow for us side by side, leaf overlapping leaf, till the Earth was white and red with them, if we cared to have it so. And Paradise was full of pleasant shades and fruitful avenues. Well: what hinders us from covering as much of the world as we like with pleasant shade, and pure blossom, and goodly fruit? Who forbids its valleys to be covered over with corn till they laugh and sing? Who prevents its dark forests, ghostly and uninhabitable, from being changed into infinite orchards, wreathing the hills with frail-floreted snow, far away to the half-lighted horizon of April, and flushing the face of all the autumnal earth with glow of clustered food? But Paradise

¹ [Genesis ii. 15; iii. 24.]

was a place of peace, we say, and all the animals were gentle servants to us. Well: the world would yet be a place of peace if we were all peacemakers, and gentle service should we have of its creatures if we gave them gentle mastery. But so long as we make sport of slaying bird and beast,¹ so long as we choose to contend rather with our fellows than with our faults, and make battlefield of our meadows instead of pasture—so long, truly, the Flaming Sword will still turn every way, and the gates of Eden remain barred close enough, till we have sheathed the sharper flame of our own passions, and broken down the closer gates of our own hearts.

§ 2. I have been led to see and feel this more and more, as I considered the service which the flowers and trees, which man was at first appointed to keep, were intended to render to him in return for his care; and the services they still render to him, as far as he allows their influence, or fulfils his own task towards them. For what infinite wonderfulness there is in this vegetation, considered, as indeed it is, [as] the means by which the earth becomes the companion of man—his friend and his teacher! In the conditions which we have traced in its rocks, there could only be seen preparation for his existence;—the characters which enable him to live on it safely, and to work with it easily—in all these it has been inanimate and passive; but vegetation is to it as an imperfect soul, given to meet the soul of man. The earth in its depths must remain dead and cold, incapable except of slow crystalline change; but at its surface,² which human beings look upon and deal with, it ministers to them through a veil of strange intermediate being: which breathes, but has no voice; moves, but cannot leave its

¹ [On this subject, see below, pp. 340–341.]

² [The following passage was much rewritten; the first draft stood thus:—

“ . . . ; but at its surface, when human beings are to touch and look upon it, it is permitted to minister to them through a veil of strange intermediate being; and the plant, with its root in the cold rock, and the rough and strange substance that has life without consciousness, death without bitterness, is neither alive nor dead, which moves and cannot leave its appointed place: has this message of life and death—a youth without expectation, and age without sorrow.”]

appointed place ; passes through life without consciousness, to death without bitterness ; wears the beauty of youth, without its passion ; and declines to the weakness of age, without its regret.

§ 3. And in this mystery of intermediate being, entirely subordinate to us, with which we can deal as we choose, having just the greater power as we have the less responsibility for our treatment of the unsuffering creature, most of the pleasures which we need from the external world are gathered, and most of the lessons we need are written,¹ all kinds of precious grace and teaching being united in this link between the Earth and Man ; wonderful in universal adaptation to his need, desire, and discipline ; God's daily preparation of the earth for him, with beautiful means of life. First, a carpet to make it soft for him ; then, a coloured fantasy of embroidery thereon ; then, tall spreading of foliage to shade him from sun heat, and shade also the fallen rain, that it may not dry quickly back into the clouds, but stay to nourish the springs among the moss.

¹ [Ruskin here curtailed in revising. The MS. has the following additional passage :—

“ . . . are written. Animals are wayward teachers ; we cannot always tell what they are meant to say to us ; it looks as if the bee rather overdid her pattern things of industry : and one would be glad if the sheep were a little more intelligent in her innocence, and knew a little better what she was about. But a tree can do no wrong, cannot fall short in any way of being what it ought to be : if it fails in any wise, we know it is its misfortune, not its fault : and we can learn of it nothing but the truth and right, under any circumstances. So also we need not be under any troublesome remorse in putting it to our service. We may ill-treat it, forget it, starve it, overwork it, and yet have no weight of misery laid at our door, and if we waste its goodness, we shall in the end suffer for it ourselves only, which it is satisfactory to generous people to know—when they have ill-treated any creatures. And the more we think of it, the more wonderful appears this link between the Earth and Man ; wonderful in its universal adaptation to his need, desire, and discipline. To his need—for it is his food, his clothing, his shade, and his heat. Of serviceable animals, those are most necessary to him which feed most on plants—which are, in fact, little more than vital transferring powers, turning the pasture into milk, or refining the mulberry leaf into thread. But supposing no animals existed at all, so long as man has corn, wine, fruit, flax, cotton, and wood, of which coal is only a compressed and undecaying form, his life is possible to him, and may be pleasurable. Plants are, in fact, the visible, beautiful means of life—God's preparation of the Earth before him daily. First, a carpet . . .”]

Stout wood to bear this leafage : easily to be cut, yet tough and light, to make houses for him, or instruments (lance-shaft, or plough-handle, according to his temper); useless it had been, if harder; useless, if less fibrous; useless, if less elastic. Winter comes, and the shade of leafage falls away, to let the sun warm the earth; the strong boughs remain, breaking the strength of winter winds. The seeds which are to prolong the race, innumerable according to the need, are made beautiful and palatable, varied into infinitude of appeal to the fancy of man, or provision for his service: cold juice, or glowing spice, or balm, or incense, softening oil, preserving resin, medicine of styptic, febrifuge, or lulling charm: and all these presented in forms of endless change. Fragility or force, softness and strength, in all degrees and aspects; unerring uprightness, as of temple pillars, or unguided wandering of feeble tendrils on the ground; mighty resistances of rigid arm and limb to the storms of ages, or wavings to and fro with faintest pulse of summer streamlet. Roots cleaving the strength of rock, or binding the transience of the sand; crests basking in sunshine of the desert, or hiding by dripping spring and lightless cave; foliage far tossing in entangled fields beneath every wave of ocean—clothing, with variegated, everlasting films, the peaks of the trackless mountains, or ministering at cottage doors to every gentlest passion and simplest joy of humanity.

§ 4. Being thus prepared for us in all ways, and made beautiful, and good for food, and for building, and for instruments of our hands, this race of plants, deserving boundless affection and admiration from us, becomes, in proportion to their obtaining it, a nearly perfect test of our being in right temper of mind and way of life; so that no one can be far wrong in either who loves the trees enough, and every one is assuredly wrong in both who does not love them, if his life has brought them in his way. It is clearly possible to do without them, for the great companionship of the sea and sky are all that sailors need; and many a noble heart has been taught the best it had to learn between

dark stone walls. Still if human life be cast among trees at all, the love borne to them is a sure test of its purity. And it is a sorrowful proof of the mistaken ways of the world that the "country," in the simple sense of a place of fields and trees, has hitherto been the source of reproach to its inhabitants, and that the words "countryman, rustic, clown, paysan, villager," still signify a rude and untaught person, as opposed to the words "townsman" and "citizen."¹ We accept this usage of words, or the evil which it signifies, somewhat too quietly; as if it were quite necessary and natural that country-people should be rude, and townspeople gentle. Whereas I believe that the result of each mode of life may, in some stages of the world's progress, be the exact reverse; and that another use of words may be forced upon us by a new aspect of facts, so that we may find ourselves saying: "Such and such a person is very gentle and kind—he is quite rustic; and such and such another person is very rude and ill-taught—he is quite urbane."

§ 5. At all events, cities have hitherto gained the better part of their good report through our evil ways of going on in the world generally; chiefly and eminently through our bad habit of fighting with each other. No field, in the Middle Ages, being safe from devastation, and every country lane yielding easier passage to the marauders, peacefully-minded men necessarily congregated in cities, and walled themselves in, making as few cross-country roads as possible: while the men who sowed and reaped the harvests of Europe were only the servants or slaves of the barons. The disdain of all agricultural pursuits by the nobility, and of all plain facts by the monks, kept educated Europe in a state of mind over which natural phenomena could have no power; body and intellect being lost in the practice of war without purpose, and the meditation of words without meaning. Men learned the dexterity with sword and syllogism, which they

¹ [In writing to his father from Lucerne (October 28, 1861) Ruskin says:

"In the first chapter of my fifth volume, in speaking of the names of country people which have a reproachful signification, I believe I missed 'villain.' It should be put in the margin."]

mistook for education, within cloister and tilt-yard; and looked on all the broad space of the world of God mainly as a place for exercise of horses, or for growth of food.

§ 6. There is a beautiful type of this neglect of the perfectness of the Earth's beauty, by reason of the passions of men, in that picture of Paul Uccello's of the battle of Sant' Egidio,* in which the armies meet on a country road beside a hedge of wild roses; the tender red flowers tossing above the helmets, and glowing between the lowered lances. For in like manner the whole of Nature only shone hitherto for man between the tossing of helmet-crests; and sometimes I cannot but think of the trees of the earth as capable of a kind of sorrow,¹ in that imperfect life of theirs, as they opened their innocent leaves in the warm spring-time, in vain for men; and all along the dells of England her beeches cast their dappled shade only where the outlaw drew his bow, and the king rode his careless chase; and by the sweet French rivers their long ranks of poplar waved in the twilight, only to show the flames of burning cities on the horizon, through the tracery of their stems; amidst the fair defiles of the Apennines, the twisted olive-trunks hid the ambushes of treachery; and on their valley meadows, day by day, the lilies which were white at the dawn were washed with crimson at sunset.

§ 7. And indeed I had once purposed, in this work, to show² what kind of evidence existed respecting the possible influence of country life on men; it seeming to me, then, likely that here and there a reader would perceive this to

* In our own National Gallery. It is quaint and imperfect, but of great interest.³

¹ [Compare *Time and Tide*, § 166, where Ruskin quotes this "dreaming fancy of long ago."]

² [The first draft reads:—

"§ 7. Thus far I had written long ago; it then presenting itself strongly to my mind, as an integral part of my task, to show . . ."]

³ [No. 583. The picture has been supposed to represent the battle of Sant' Egidio, July 7, 1416, in which Carlo Malatesta and his nephew, Galeazzo, were taken prisoners by Braccio di Montone, Lord of Perugia; but this identification of the subject is open to some doubt (see an article in the *Monthly Review*, October 1901). Ruskin refers again to the picture below (p. 368).]

be a grave question, more than most which we contend about, political or social, and might care to follow it out with me earnestly.

The day will assuredly come when men will see that it *is* a grave question; at which period, also, I doubt not, there will arise persons able to investigate it. For the present, the movements of the world seem little likely to be influenced by botanical law; or by any other considerations respecting trees, than the probable price of timber.¹ I shall limit myself, therefore, to my own simple woodman's work, and try to hew this book into its final shape, with the limited and humble aim that I had in beginning it, namely, to prove how far the idle and peaceable persons, who have hitherto cared about leaves and clouds, have rightly seen, or faithfully reported of them.

¹ [Here, again, the first draft is different:—

“ . . . price of timber. Having been now three years diverted from my work, and had occasion in the meantime to examine into a few of the main-springs of the world's motions, I perceive that those motions are by no means likely to be influenced by Vegetation—nor by any considerations arising out of the contemplation of it. The world will probably for a few years set little store by any sort of leaves; and by leaves of the tree of life, least of all; and will accordingly gather not many, needing rather for its healthy medicine—it may cheerfully be hoped—leaves of nettle and thistle than such as are for the healing of the nations.”

These passages are of value in fixing the date of composition; see above, Introduction, p. lvii.]

CHAPTER II

THE LEAF-ORDERS

§ 1. As in our sketch of the structure of mountains it seemed advisable to adopt a classification of their forms, which, though inconsistent with absolute scientific precision, was convenient for order of successive inquiry, and gave useful largeness of view;¹ so, and with yet stronger reason, in glancing at the first laws of vegetable life, it will be best to follow an arrangement easily remembered and broadly true, however incapable of being carried out into entirely consistent detail. I say, "with yet stronger reason," because more questions are at issue among botanists than among geologists; a greater number of classifications have been suggested for plants than for rocks; nor is it unlikely that those now accepted may be hereafter modified. I take an arrangement, therefore, involving no theory; serviceable enough for all working purposes, and sure to remain thus serviceable, in its rough generality, whatever views may hereafter be developed among botanists.

§ 2. A child's division of plants is into "trees and flowers." If, however, we were to take him in spring, after he had gathered his lapful of daisies, from the lawn into the orchard, and ask him how he would call those wreaths of richer floret, whose frail petals tossed their foam of promise between him and the sky, he would at once see the need of some intermediate name, and call them, perhaps, "tree-flowers." If, then, we took him to a birch-wood, and showed him that catkins were flowers, as well as cherry-blossoms, he might, with a little help, reach so far as to divide all flowers into two classes; one, those that grew

¹ [See Vol. VI. pp. 128-133.]

on ground; and another, those that grew on trees. The botanist might smile at such a division; but an artist would not. To him, as to the child, there is something specific and distinctive in those rough trunks that carry the higher flowers. To him, it makes the main difference between one plant and another, whether it is to tell as a light upon the ground, or as a shade upon the sky. And if, after this, we asked for a little help from the botanist, and he were to lead us, leaving the blossoms, to look more carefully at leaves and buds, we should find ourselves able in some sort to justify, even to him, our childish classification. For our present purposes, justifiable or not, it is the most suggestive and convenient. Plants are, indeed, broadly referable to two great classes. The first we may, perhaps, not inexpediently call TENTED PLANTS.¹ They live in encampments, on the ground, as lilies; or on surfaces of rock, or stems of other plants, as lichens and mosses. They live—some for a year, some for many years, some for myriads of years; but, perishing, they pass as the tented Arab passes; they leave *no memorials of themselves*,² except the seed, or bulb, or root which is to perpetuate the race.

§ 3. The other great class of plants we may perhaps best call BUILDING PLANTS. These will *not* live on the ground, but eagerly raise edifices above it. Each works hard with solemn forethought all its life. Perishing, it leaves its work in the form which will be most useful to its successors—its own monument, and their inheritance. These architectural edifices we call “Trees.”

It may be thought that this nomenclature already involves a theory. But I care about neither the nomenclature, nor about anything questionable in my description of the classes. The reader is welcome to give them what names he likes, and to render what account of them he thinks fittest. But to us, as artists, or lovers of art, this

¹ [In the MS. Ruskin had called them “Ground Plants,” living “either on the ground or on surfaces which are ground to them, as lichens . . .”]

² [See Ecclesiasticus xlv. 9.]

is the first and most vital question concerning a plant: "Has it a fixed form or a changing one? Shall I find it always as I do to-day—this *Parnassia palustris*—with one leaf and one flower? or may it some day have incalculable pomp of leaves and unmeasured treasure of flowers? Will it rise only to the height of a man—as an ear of corn—and perish like a man; or will it spread its boughs to the sea and branches to the river,¹ and enlarge its circle of shade in heaven for a thousand years?"

§ 4. This, I repeat, is the *first* question I ask the plant. And as it answers, I range it on one side or the other, among those that rest or those that toil; tent-dwellers, who toil not, neither do they spin;² or tree-builders, whose days are as the days of a people. I find again, on farther questioning these plants who rest, that one group of them does indeed rest always, contentedly, on the ground, but that those of another group, more ambitious, emulate the builders; and though they cannot build rightly, raise for themselves pillars out of the remains of past generations, on which they themselves, living the life of St. Simeon Stylites, are called, by courtesy, Trees; being, in fact, many of them (palms, for instance) quite as stately as real trees.*

These two classes we might call earth-plants, and pillar-plants.

§ 5. Again, in questioning the true builders as to their modes of work, I find that they also are divisible into two great classes. Without in the least wishing the reader to accept the fanciful nomenclature, I think he may yet most

* I am not sure that this is a fair account of palms. I have never had opportunity of studying stems of *Endogens*, and I cannot understand the descriptions given of them in books, nor do I know how far some of their branched conditions approximate to real tree-structure. If this work, whatever errors it may involve, provokes the curiosity of the reader so as to lead him to seek for more and better knowledge, it will do all the service I hope from it.

¹ [Psalm lxxx. 11.]
² [Matthew vi. 28.]

conveniently remember these as "Builders with the shield," and "Builders with the sword."

Builders with the shield have expanded leaves, more or less resembling shields, partly in shape, but still more in office; for under their lifted shadow the young bud of the next year is kept from harm. These are the gentlest of the builders, and live in pleasant places, providing food and shelter for man. Builders with the sword, on the contrary, have sharp leaves in the shape of swords, and the young buds, instead of being as numerous as the leaves, crouching each under a leaf-shadow, are few in number, and grow fearlessly, each in the midst of a sheaf of swords. These builders live in savage places, are sternly dark in colour, and though they give much help to man by their merely physical strength, they (with few exceptions) give him no food, and imperfect shelter. Their mode of building is ruder than that of the shield-builders, and they in many ways resemble the pillar-plants of the opposite order. We call them generally "Pines."

§ 6. Our work, in this section, will lie only among the shield-builders, sword-builders, and plants of rest. The Pillar-plants belong, for the most part, to other climates. I could not analyze them rightly: and the labour given to them would be comparatively useless for our present purposes. The chief mystery of vegetation, so far as respects external form, is among the fair shield-builders. These, at least, we must examine fondly and earnestly.

CHAPTER III

THE BUD

§ 1. If you gather, in summer time, an outer spray of any shield-leaved tree, you will find it consists of a slender rod, throwing out leaves, perhaps on every side, perhaps on two sides only, with usually a cluster of closer leaves at the end. In order to understand its structure, we must reduce it to a simple general type. Nay, even to a very inaccurate type. For a tree-branch is essentially a complex thing, and no "simple" type can, therefore, be a right one.

§ 2. This type I am going to give you is full of fallacies and inaccuracies; but out of these fallacies we will bring the truth by casting them aside one by one.

Let the tree spray be represented under one of these two types, A or B, Fig. 1, the cluster at the end being in each case supposed to consist of three leaves only (a most impertinent supposition, for it must at least have four, only the fourth would be in a puzzling perspective in A, and hidden behind the central leaf in B). So, receive this false type patiently. When leaves are set on the stalk one after another as in A, they are called "alternate"; when placed as in B, "opposite." It is necessary you should remember this not very difficult piece of nomenclature.

If you examine the branch you have gathered, you will see that for some little way below the full-leaf cluster at

the end, the stalk is smooth, and the leaves are set regularly on it. But at six, eight, or ten inches down, there comes an awkward knot; something seems to have gone wrong, perhaps another spray branches off there; at all events, the stem gets suddenly thicker, and you may break it there (probably) easier than anywhere else.

That is the junction of two stories of the building. The smooth piece has all been done this summer. At the knot the foundation was left during the winter.

The year's work is called a "shoot." I shall be glad if you will break it off to look at, as my A and B types are supposed to go no farther down than the knot.

The alternate form A is more frequent than B, and some botanists think includes B. We will, therefore, begin with it.

§ 3. If you look close at the figure, you will see small projecting points at the roots of the leaves. These represent buds, which you may find, most probably, in the shoot you have in your hand. Whether you find them or not, they are there—visible, or latent, does not matter. Every leaf has assuredly an infant bud to take care of, laid tenderly, as in a cradle, just where the leaf-stalk forms a safe niche between it and the main stem. The child-bud is thus fondly guarded all summer; but its protecting leaf dies in the autumn; and then the boy-bud is put out to rough winter-schooling, by which he is prepared for personal entrance into public life in the spring.

Fig. 2

Let us suppose autumn to have come, and the leaves to have fallen. Then our A of Fig. 1, the buds only being left, one for each leaf, will appear as A B, in Fig. 2. We will call the buds grouped at B, terminal buds, and those at a, b, and c, lateral buds.

This budded rod is the true year's work of the building plant, at that part of its edifice. You may consider the little spray, if you like, as one pinnacle of the tree-cathedral, which has taken a year to fashion; innumerable

other pinnacles having been built at the same time on other branches.

§ 4. Now, every one of these buds, *a*, *b*, and *c*, as well as every terminal bud, has the power and disposition to raise himself, in the spring, into just such another pinnacle as *A B* is.

This development is the process we have mainly to study in this chapter; but, in the outset, let us see clearly what it is to end in.

Each bud, I said, has the power and disposition to make a pinnacle of himself, but he has not always the oppor-

tunity. What may hinder him we shall see presently. Meantime, the reader will, perhaps, kindly allow me to assume that the buds *a*, *b*, and *c*, come to nothing, and only the three terminal ones build forward. Each of these producing the image of the first pinnacle, we have the type for our next summer bough of Fig. 3; in which observe the original shoot *A B* has become thicker; its lateral buds having proved abortive, are now only seen as little knobs on its sides.

Fig. 3

Its terminal buds have each risen into a new pinnacle. The central or strongest one, *B c*, has become the very image of what his parent shoot, *A B*, was last year. The two lateral ones are weaker and shorter, one probably longer than the other. The joint at *B* is the knot or foundation for each shoot above spoken of.

Knowing now what we are about, we will go into closer detail.

§ 5. Let us return to the type in Fig. 2, of the fully accomplished summer's work: the rod with its bare buds.

51. The Dryads Toil.

Plate 51,¹ opposite, represents, of about half its real size, an outer spray of oak in winter. It is not growing strongly, and is as simple as possible in ramification. You may easily see, in each branch, the continuous piece of shoot produced last year. The wrinkles which make these shoots look like old branches are caused by drying, as the stalk of a bunch of raisins is furrowed (the oak-shoot fresh gathered is round as a grape stalk). I draw them thus, because the furrows are important clues to structure. Fig. 4 is the top of one of these oak sprays magnified for reference. The little brackets, *x*, *y*, etc., which project beneath each bud and sustain it, are the remains of the leaf-stalks. Those stalks were jointed at that place, and the leaves fell without leaving a scar, only a crescent-shaped, somewhat blank-looking flat space, which you may study at your ease on a horse-chestnut stem, where the spaces are very large.

Fig. 4

§ 6. Now, if you cut your oak spray neatly through, just above a bud, as at A, Fig. 4, and look at it with a not very powerful magnifier, you will find it present the pretty section, Fig. 5.

Fig. 5

That is the proper or normal section of an oak spray. Never quite regular. Sure to have one of the projections a little larger than the rest, and to have its bark (the black line) not quite regularly put round it, but exquisitely finished, down to a little white star in the very centre, which I have not drawn, because it would look in the woodcut black, not white; and be too conspicuous.

The oak spray, however, will not keep this form unchanged for an instant. Cut it through a little way above your first

¹ [For a note on this Plate, see Vol. XV. p. xxiii. n.]

section, and you will find the largest projection is increasing till, just where it opens* at last into the leaf-stalk, its section is Fig. 6. If, therefore, you choose to consider every interval between bud and bud as one story of your tower or pinnacle, you find that there is literally not a hair's-breadth of the work in which the *plan* of the tower does not change. You may see in Plate 51 that every shoot is affected by a subtle (in nature an *infinitely* subtle) change of contour between bud and bud.

Fig. 6

§ 7. But farther, observe in what succession those buds are put round the bearing stem. Let the section of the stem be represented by the small central circle in Fig. 8; and suppose it surrounded by a *nearly* regular pentagon (in the figure it is quite regular for clearness' sake). Let the first of any ascending series of buds be represented by the curved projection filling the nearest angle of the pentagon at 1. Then the next bud, above, will fill the angle at 2; the next above at 3, the next at 4, the next at 5. The sixth will come nearly over the first. That is to say, each projecting portion of the section, Fig. 5, expands into its bud, not successively,

Fig. 8

* The added portion, surrounding two of the sides of the pentagon, is the preparation for the stalk of the leaf, which, on detaching itself from the stem, presents variable sections, of which those numbered 1 to 4, Fig. 7, are

Fig. 7

examples. I cannot determine the proper normal form. The bulb-shaped spot in the heart of the uppermost of the five projections in Fig. 6 is the root of the bud.

but by leaps, always to the *next but one*; the buds being thus placed in a nearly regular spiral order.

§ 8. I say nearly regular—for there are subtleties of variation in plan which it would be merely tiresome to enter into. All that we need care about is the general law, of which the oak spray furnishes a striking example,—that the buds of the first great group of alternate builders rise in a spiral order round the stem (I believe, for the most part, the spiral proceeds from right to left). And this spiral succession very frequently approximates to the pentagonal order, which it takes with great accuracy in an oak; for, merely assuming that each ascending bud places itself as far as it can easily out of the way of the one beneath, and yet not quite on the opposite side of the stem, we find the interval between the two must generally approximate to that left between 1 and 2, or 2 and 3, in Fig. 8.*

§ 9. Should the interval be consistently a little *less* than that which brings out the pentagonal structure, the plant seems to get at first into much difficulty. For, in such case, there is a probability of the buds falling into a triangle, as at A, Fig. 9; and then the fourth must come over the first, which would be inadmissible (we shall soon see why). Nevertheless, the plant seems to like the triangular result for its outline, and sets itself to get out of the difficulty with much ingenuity, by methods of succession which I will examine farther in the next chapter:¹ it being enough for us to know at present that the puzzled but persevering vegetable *does* get out of its difficulty, and issues triumphantly, and with a peculiar expression of leafy exultation, in a hexagonal star, composed of two distinct

Fig. 9

* For more accurate information the reader may consult Professor Lindley's *Introduction to Botany* (Longman, 1848), vol. i. p. 245, *et seqq.*

¹ [See § 12, p. 45; and for the following reference, §§ 9-10, pp. 42-43.]

triangles, normally as at B, Fig. 9. Why the buds do not

Fig. 10

like to be one above another, we shall see in next chapter. Meantime I must shortly warn the reader of what we shall then discover, that, though we have spoken of the projections of our pentagonal tower as if they were first built to sustain each its leaf, they are themselves chiefly built by the leaf they seem to sustain. Without troubling ourselves about this yet, let us fix in our minds broadly the effective aspect of the matter, which is all we want, by a simple practical illustration.

§ 10. Take a piece of stick half an inch thick, and a yard or two long, and tie large knots, at any *equal* distances you choose, on a piece of pack-thread. Then wind the pack-thread round the stick, with any number of equidistant turns you choose, from one end to the other, and the knots will take the position of buds in the general type of alternate vegetation. By varying the number of knots and the turns of the thread, you may get the

system of any tree, with the exception of one character only, viz., that since the shoot grows faster at one time than

another, the buds run closer together when the growth is slow. You cannot imitate this structure by closing the coils of your string, for that would alter the positions of your knots irregularly. The intervals between the buds are, by this gradual acceleration or retardation of growth, usually varied in lovely proportions. Fig. 10 shows the elevations of the buds on five different sprays of oak; A and B being of the real size (short shoots); C, D, and E, on a reduced scale. I have not traced the cause of the apparent tendency of the buds to follow in pairs, in these longer shoots.

§ 11. Lastly: if the spiral be constructed so as to bring the buds nearly on opposite sides of the stem, though alternate in succession, the stem, most probably, will shoot a little away from each bud after throwing it off, and thus establish the oscillatory form *b*, Fig. 11, which, when the buds are placed, as in this case, at diminishing intervals, is very beautiful.*

§ 12. I fear this has been a tiresome chapter; but it is necessary to master the elementary structure, if we are to understand anything of trees; and the reader will therefore, perhaps, take patience enough to look at one or two examples of the spray structure of the second great class of builders, in which the leaves are opposite. Nearly all opposite-leaved trees grow, normally, like vegetable weather-cocks run to seed, with north and south, and east and west pointers thrown off alternately one over another, as in Fig. 12.

This, I say, is the normal condition. Under certain

Fig 11

* Fig. 11 is a shoot of the line, drawn on two sides, to show its continuous curve in one direction, and alternated curves in another. The buds, which may be seen to be at equal heights in the two figures, are exquisitely proportioned in their distances. There is no end to the refinement of system, if we choose to pursue it.

circumstances, north and south pointers set themselves north-east and south-west; this concession being acknowledged and imitated by the east and west pointers at the next opportunity; but for the present, let us keep to our simple form.

Fig. 12.

The first business of the budding stem, is to get every pair of buds set accurately at right angles to the one below. Here are some examples of the way it contrives this. A, Fig. 13, is the section of the stem of a spray of box, magnified eight or nine times, just where it throws off two of its leaves, suppose on north and south sides. The crescents below and above are sections through the leaf-stalks thrown off on each side. Just

above this joint, the section of the stem is B, which is the normal section of a box-stem, as Fig. 5 is of an oak's. This, as it ascends, becomes C, elongating itself now east and west; and the section next to C would be again A turned that way; or, taking the succession completely through two joints, and of the real size, it would be thus: Fig. 14.

The stem of the spotted aucuba is normally hexagonal, as that of the box is normally square. It is very dexterous and delicate in its mode of transformation to the two sides.

Through the joint it is A, Fig. 15. Above joint, B, normal passing on into C, and D for the next joint.

While in the horse-chestnut, a larger tree, and, as we shall see hereafter, therefore less regular in conduct, the section, normally hexagonal, is much rounded and softened

Fig. 13

into irregularities; A, Fig. 16, becoming, as it buds, B and C. The dark diamond beside C is a section through a bud, in which, however small, the quatrefoil disposition is always seen complete: the four little infant leaves with a queen leaf in the middle, all laid in their fan-shaped feebleness, safe in a white cloud of miniature woollen blanket.

Fig. 14

§ 13. The elementary structure of all important trees may, I think, thus be resolved into three principal forms: three-leaved, Fig. 9; four-leaved, Figs. 13 to 16; and five-leaved, Fig. 8. Or, in well-known terms, trefoil, quatrefoil, cinqfoil. And these are essential classes, more complicated forms being usually, it seems to me, resolvable into these, but these not into each other. The simplest arrangement (Fig. 11), in which the buds are nearly opposite in position, though alternate in

Fig. 15

elevation, cannot, I believe, constitute a separate class, being only an accidental condition of the spiral. If it did, it might be called difoil; but the important classes are three:—

Trefoil, Fig. 9: Type, Rhododendron.

Quatrefoil, Fig. 13: Type, Horse-chestnut.

Cinqfoil, Fig. 5: Type, Oak.

§ 14. The coincidences between beautiful architecture and the construction of trees must more and more have become marked in the reader's mind as we advanced; and if he will now look at what I have said in other places of the use and

meaning of the trefoil, quatrefoil, and cinqfoil, in Gothic architecture,¹ he will see why I could hardly help thinking and speaking of all trees as builders. But there is yet one more subtlety in their way of building which we have not noticed. If the reader will look carefully at the separate shoots in Plate 51, he will see that the furrows of the stems fall in almost every case into continuous spiral curves, carrying the whole system of buds with them. This super-

Fig. 16

induced spiral action, of which we shall perhaps presently discover the cause, often takes place vigorously, producing completely twisted stems of great thickness. It is nearly always existent slightly, giving farther grace and change to the whole wonderful structure. And thus we have, as the final result of one year's vegetative labour on any single spray, a twisted tower, not similar at any height of its building: or (for, as we shall see presently, it loses in diameter at each

bud) a twisted spire, correspondent somewhat in principle to the twisted spire of Dijon, or twisted fountain of Ulm, or twisted shafts of Verona.² Bossed as it ascends with living sculpture, chiselled, not by diminution but through increase, it rises by one consistent impulse from its base to

¹ [See *Seven Lamps* (Vol. VIII. pp. 126, 129 n., 133; *Stones of Venice*, vol. ii. (Vol. X. pp. 53, 257-258, 259-260); and compare *Modern Painters*, vol. iv. (Vol. VI. p. 244).]

² [The "twisted spire" of Dijon no longer exists; the old spire of the Cathedral of St. Benigné was slightly bent, but it was rebuilt without the twist in 1894-1895. The old spire is alluded to in the opening lines of Miss Betham-Edwards's *Romance of Dijon*; Ruskin refers to it again in *Ethics of the Dust*, § 97. The wreathed fountain in the market-square of Ulm is the work of Jörg Syrlin the elder (1482); Ruskin was there in 1835 (see his drawing of the cathedral, Plate 1 in Vol. I.). For the twisted shafts of Verona, see Fig. 18 and Plate 17 in *Stones of Venice*, vol. i. (Vol. IX. pp. xxxiv., 132, 377).]

its minaret, ready, in spring-time, to throw round it at the crest at once the radiance of fresh youth and the promise of restoration after that youth has passed away. A marvellous creation; nay, might we not almost say, a marvellous creature, full of prescience in its infancy, foreboding even, in the earliest gladness of its opening to sunshine, the hour of fainting strength and falling leaf, and guarding under the shade of its faithful shields the bud that is to bear its hope through winter's shieldless sleep?

Men often look to bring about great results by violent and unprepared effort. But it is only in fair and forecast order, "as the earth bringeth forth her bud,"¹ that righteousness and praise may spring forth before the nations.

¹ [Isaiah lxi. 11.]

CHAPTER IV

THE LEAF

§ 1. HAVING now some clear idea of the position of the bud, we have next to examine the forms and structure of its shield—the leaf which guards it. You will form the best general idea of the flattened leaf of shield-builders by thinking of it as you would of a mast and sail. More consistently with our classification, we might perhaps say, by thinking always of the arm sustaining the shield; but we should be in danger of carrying fancy too far, and the likeness of mast and sail is closer, for the mast tapers as the leaf-rib does, while the hand holding the uppermost strap of the buckler clenches itself. Whichever figure we use, it will cure us of the bad habit of imagining a leaf composed of a short stalk with a broad expansion at the end of it. Whereas we should always think of the stalk as running right up the leaf to its point, and carrying the expanded, or foliate part, as the mast of a lugger does its sail. To some extent, indeed, it has yards also, ribs branching from the innermost one; only the yards of the leaf will not run up and down, which is one essential function of a sailyard.

§ 2. The analogy will, however, serve one step more. As the sail must be on one side of the mast, so the expansion of a leaf is on one side of its central rib, or of its system of ribs. It is laid over them as if it were stretched over a frame, so that on the upper surface it is comparatively smooth; on the lower, barred. The understanding of the broad relations of these parts is the principal work we have to do in this chapter.

§ 3. First, then, you may roughly assume that the section

of any leaf-mast will be a crescent, as at *a*, Fig. 17 (compare Fig. 7 above). The flat side is the uppermost, the round side underneath, and the flat or upper side carries the leaf. You can at once see the convenience of this structure for fitting to a central stem. Suppose the central stem has a little hole in the centre, *b*, Fig. 17, and that you cut it down through the middle (as terrible knights used to cut their enemies in the dark ages, so that half the head fell on one side, and half on the other): Pull the two halves separate, *c*, and they will nearly represent the shape and position of opposite leaf-ribs. In reality the leaf-stalks have to fit themselves to the central stem, *a*, and as we shall see presently, to lap round it; but we must not go too fast.

Fig. 17

§ 4. Now, *a*, Fig. 17, being the general type of a leaf-stalk, Fig. 18 is the general type of the way it expands

Fig. 18

into and carries its leaf; * this figure being the enlargement of a typical section right across any leaf, the dotted lines show the under surface foreshortened. You see I have made one side broader than the other. I mean that. It is typically so. Nature cannot endure two sides of a leaf to be alike. By encouraging one side more than the other, either by giving it more air or light, or perhaps in a chief

* I believe the undermost of the two divisions of the leaf represents vegetable tissue *returning* from the extremity. See Lindley's *Introduction to Botany* (1848), vol. i. p. 253.

degree by the mere fact of the moisture necessarily accumulating on the lower edge when it rains, and the other always drying first, she contrives it so, that if the essential form or idea of the leaf be *a*, Fig. 19, the actual form will

Fig. 19

always be *c*, or an approximation to it; one half being pushed in advance of the other, as at *b*, and all reconciled by soft curvature, *c*. The effort of the leaf to keep itself symmetrical rights it, however, often at the point, so that the insertion of the stalk only makes the inequality manifest. But it follows that the sides of a straight section across the leaf

are unequal all the way up, as in my drawing, except at one point.

§ 5. I have represented the two wings of the leaf as slightly convex on the upper surface. This is also on the whole a typical character. I use the expression "wings of the leaf," because, supposing we exaggerate the main rib a little, the section will generally resemble a bad painter's type of a bird (*a*, Fig. 20). Sometimes the outer edges curl up, *b*, but an entirely concave form, *c*, is rare. When *b* is strongly developed, closing well in, the leaf gets a good deal the look of a boat with a keel.

§ 6. If now you take this oblique form of sail, and cut it into any required number of pieces down to its mast, as in Fig. 21, *A*, and then suppose each of the pieces to contract into studding-sails at the side, you will have whatever type of divided leaf you choose to shape it for. In Fig. 21, *A*, *B*, *I* have taken the rose, as the simplest type. The leaf is given in separate contour at *c*; but that of the mountain ash, *A*, Fig. 22, suggests the original oval form which encloses all the subdivisions much more beautifully. Each of the studding-sails in this ash-leaf looks much at first as if he were himself a mainsail. But you may know him always to be a subordinate, by observing that the inequality of the two sides,

Fig. 20

which is brought about by accidental influences in the mainsail, is an organic law in the studding-sail. The real leaf tries to set itself evenly on its mast; and the inequality is only a graceful concession to circumstances. But the subordinate or studding-sail is always *by law* larger at one side than the other; and if he is himself again divided into smaller sails, he will have larger sails on the lowest side, or one more sail on the lowest side, than he has on the other. He always wears, therefore, a servant's, or, at least, subordinate's dress. You may know him anywhere as

Fig. 21

not the master. Even in the ash leaflet, of which I have outlined one separately, B, Fig. 22, this is clearly seen; but it is much more distinct in more finely divided leaves.*

§ 7. Observe, then, that leaves are broadly divisible into mainsails and studding-sails; but that the word *leaf* is properly to be used only of the mainsail; leaflet is the best word for minor divisions; and whether these minor members are only separated by deep cuts, or become complete stalked leaflets, still they are always to be thought of merely as parts of a true leaf.

It follows from the mode of their construction that leaflets must always lie more or less *flat*, or edge to edge, in

* For farther notes on this subject, see my *Elements of Drawing*, p. 286 [now § 214, Vol. XV. p. 186].

a continuous plane. This position distinguishes them from true leaves as much as their oblique form, and distinguishes them with the same delicate likeness of system; for as the true leaf takes, accidentally and partially, the oblique outline which is legally required in the subordinate, so the true leaf takes accidentally and partially the flat disposition which is legally required in the subordinate. And this point of position we must now study. Henceforward, throughout this chapter, the reader will please note that I speak only of true *leaves*, not of *leaflets*.

Fig. 22

§ 8. LAW I. THE LAW OF DEFLECTION.—The first law, then, respecting position in true leaves, is that they fall gradually back from the uppermost one, or uppermost group. They are never set as at *a*, Fig. 23, but always as at *b*. The reader may see at once that they have more room and comfort by means of the latter arrangement. The law is carried out with more or less distinctness accord-

ing to the habit of the plant; but is always acknowledged.

In strong-leaved shrubs or trees it is shown with great distinctness and beauty: the Phillyrea shoot, for instance, Fig. 24, is almost in as true symmetry as a Greek honeysuckle ornament.¹ In the hawthorn shoot, central in Plate 52, opposite,² the law is seen very slightly, yet it rules all

¹ [Compare *Laws of Fesole* (Vol. XV. pp. 411–412).]

² [The figure on the left is a branch of blackthorn (see below, ch. viii. § 14 n.); that on the right is a bell-handle in wrought-iron from a house at Nuremburg (see below, p. 304 n.).]

the play and fantasy of the varied leaves, gradually depressing their lines as they are set lower. In crowded foliage of large trees, the disposition of each separate leaf is not so manifest. For there is a strange coincidence in this between trees and communities of men. When the community is small, people fall more easily into their places, and take, each in his place, a firmer standing than can be obtained by the individuals of a great nation. The members of a vast community are separately weaker, as an aspen or elm leaf is thin, tremulous, and directionless, compared with the spear-like setting and firm substance of a rhododendron or laurel leaf. The laurel and rhododendron are like the Athenian or Florentine republics;¹ the aspen like England—

Fig. 23

Fig. 24

strong-trunked enough when put to proof, and very good for making cartwheels of, but shaking pale with epidemic panic at every breeze.² Nevertheless, the aspen has the better of the great nation, in that if you take it bough by

¹ [Compare on this subject, Vol. XII. p. 171 and n.]

² [Compare the lines from Scott's *Marmion*, canto vi. stanza 17 (quoted by Ruskin in *Aratra Pentelici*, § 205):—

“ . . . variable as the shade
By the light quivering aspen made.”]

bough, you shall find the gentle law of respect and room for each other truly observed by the leaves in such broken way as they can manage it; but in the nation you find every one scrambling for his neighbour's place.

This, then, is our first law, which we may generally call the Law of Deflection, or, if the position of the leaves with respect to the root be regarded, of Radiation. The second is more curious, and we must go back over our ground a little to get at it.

§ 9. LAW II. THE LAW OF SUCCESSION.—From what we saw of the position of buds,¹ it follows that in every tree the leaves at the end of the spray, taking the direction given

them by the uppermost cycle or spiral of the buds, will fall naturally into a starry group, expressive of the order of their growth. In an oak we shall have a cluster of five leaves, in a horse-chestnut of four, in a rhododendron of six, and so on. But observe, if we draw the oak-leaves all equal, as at *a*, Fig. 25, or the chestnuts (*b*), or the rhododendron's (*c*), you instantly will feel, or ought to feel, that something is wrong; that those are not foliage forms—not even normally or typically so—but dead forms, like crystals of snow. Considering this, and looking back to last chapter, you will see that the buds which throw out these leaves do not grow side by side, but one above another. In the oak and rhododendron, all five and all six buds are at different heights; in the chestnut, one couple is above the other couple.

¹ [Above, ch. iii. §§ 6–11.]

§ 10. Now, so surely as one bud is above another, it must be stronger or weaker than that other. The shoot may either be increasing in strength as it advances, or declining; in either case, the buds must vary in power, and the leaves in size. At the top of the shoot, the last or uppermost leaves are mostly the smallest; of course always so in spring as they develop.

Let us then apply these conditions to our formal figure above, and suppose each leaf to be weaker in its order of succession. The oak becomes as *a*, Fig. 26, the chestnut shoot as *b*, the rhododendron, *c*. These, I should think, it

Fig. 26

can hardly be necessary to tell the reader, are true normal forms; respecting which one or two points must be noticed in detail.

§ 11. The magnitude of the leaves in the oak star diminishes, of course, in alternate order. The largest leaf is the lowest, 1 in Fig. 8, p. 28. While the largest leaf forms the bottom, next it, opposite each other, come the third and fourth, in order and magnitude, and the fifth and second from the top. An oak star is, therefore, always an oblique star; but in the chestnut and other quatrefoil trees, though the uppermost couple of leaves must always be smaller than the lowermost couple, there appears no geometrical reason why the opposite leaves of each couple should vary in size. Nevertheless, they always do, so that the quatrefoil becomes oblique as well as the cinqfoil, as you see it is in Fig. 26.

The normal of four-foils is therefore as in Fig. 27, A (maple), with magnitudes, in order numbered; but it often happens that an opposite pair agree to become largest and

Fig. 27

smallest: thus giving the pretty symmetry, Fig. 27, B, (spotted aucuba). Of course the quatrefoil in reality is always less formal, one pair of leaves more or less hiding

Fig. 28

or preceding the other. Fig. 28 is the outline of a young one in the maple.

§ 12. The third form is more complex, and we must take the pains to follow out what we left unobserved in

last chapter respecting the way a triplicate plant gets out of its difficulties.¹

Draw a circle as in Fig. 29, and two lines, $A B$, $B C$, touching it, equal to each other, and each divided accurately in half where they touch the circle, so that $A P$ shall be equal to $P B$, $B Q$, and $Q C$. And let the lines $A B$ and $B C$ be so placed that a dotted line $A C$, joining their extremities, would not be much longer than either of them.

Continue to draw lines of the same length all round the circle. Lay five of them, $A B$, $B C$, $C D$, $D E$, $E F$. Then

Fig. 29

Fig. 30

join the points, $A D$, $E B$, and $C F$, and you have Fig. 30, which is a hexagon, with the following curious properties. It has one side largest, $C D$, two sides less, but equal to each other, $A E$ and $B F$; and three sides less still, and equal to each other, $A D$, $C F$, and $B E$.

Now put leaves into this hexagon, Fig. 31, and you will see how charmingly the rhododendron has got out of its difficulties. The next cycle will put a leaf in at the gap at the top, and begin a new hexagon. Observe, however, this geometrical figure is only to the rhododendron what the a in Fig. 25 is to the oak, the icy or dead form. To get the living normal form we must introduce our law of succession. That is to say, the five lines $A B$, $B C$, etc.,

¹ [See above, § 9, p. 29.]

must continually diminish, as they proceed, and therefore, continually approach the centre; roughly as in Fig. 32.

§ 13. I dread entering into the finer properties of this construction, but the reader cannot now fail to feel their

Fig. 31

Fig. 32

beautiful result either in the cluster in Fig. 26, or here in Fig. 33, which is a richer and more oblique one. The three leaves of the uppermost triad are perfectly seen, closing over the bud; and the general form is clear, though the lower triads are confused to the eye by unequal de-

velopment, as in these complex arrangements is almost always the case. The more difficulties are to be encountered the more license is given to the plant in dealing with them, and we shall hardly ever find a rhododendron shoot fulfilling its splendid spiral as an oak does its simple one.

Fig. 33

Here, for instance, is the actual order of ascending leaves in four rhododendron shoots which I gather at random.

Of these, A is the only quite well-conducted one; B takes one short step; C, one step backwards; and D, two steps back, and one, too short, forward.

§ 14. LAW III. THE LAW OF RESILIENCE.—If you have been gathering any branches from the trees I have

named among quatrefoils (the box is the best for exemplification), you have perhaps been embarrassed by finding that the leaves, instead of growing on four sides of the stem, did practically grow oppositely on two. But if you look closely at the places of their insertion, you will find they indeed spring on all four sides; and that in order to take the flattened opposite position, each leaf twists round on its

Fig. 34

stalk, as in Fig. 35, which represents a box-leaf magnified and foreshortened. The leaves do this in order to avoid growing downwards, where the position of the bough and bud would, if the leaves regularly kept their places, involve downward growth. The leaves always rise up on each side from beneath, and form a flattened group, more or less distinctly in proportion to the horizontality of the bough, and the contiguity of foliage below and above. I shall not trouble myself to illustrate this law, as you have only to gather a few tree-sprays to see its effect. But you must note the resulting characters on *every* leaf; namely, that not one leaf in a thousand grows without a fixed turn in its stalk, warping and varying the whole of the curve on the two edges throughout its length, and thus producing the loveliest conditions of its form. We shall presently trace the law of resilience farther on a larger scale: meanwhile, in summing the results of our inquiry thus far, let us remember that every one of these laws is observed

Fig. 35

with varying accuracy and gentle equity, according not only to the strength and fellowship of foliage on the spray itself, but according to the place and circumstances of its growth.

§ 15. For the leaves, as we shall see immediately, are the feeders of the plant. Their own orderly habits of succession must not interfere with their main business of finding food. Where the sun and air are, the leaf must go, whether it be out of order or not. So, therefore, in any group, the first consideration with the young leaves is much like that of young bees, how to keep out of each other's way, that every one may at once leave its neighbours as much free-air pasture as possible, and obtain a relative freedom for itself. This would be a quite simple matter, and produce other simply balanced forms, if each branch, with open air all round it, had nothing to think of but reconciliation of interests among its own leaves. But every branch has others to meet or to cross, sharing with them, in various advantage, what shade, or sun, or rain is to be had. Hence every single leaf-cluster presents the general aspect of a little family, entirely at unity among themselves, but obliged to get their living by various shifts, concessions, and infringements of the family rules, in order not to invade the privileges of other people in their neighbourhood.

§ 16. And in the arrangement of these concessions there is an exquisite sensibility among the leaves. They do not grow each to his own liking, till they run against one another, and then turn back sulkily; but by a watchful instinct, far apart, they anticipate their companions' courses, as ships at sea, and in every new unfolding of their edged tissue, guide themselves by the sense of each other's remote presence, and by a watchful penetration of leafy purpose in the far future. So that every shadow which one casts on the next, and every glint of sun which each reflects to the next, and every touch which in toss of storm each receives from the next, aid or arrest the development of their advancing form, and direct, as will be safest and best, the curve of every fold and the current of every vein.

§ 17. And this peculiar character exists in all the structures thus developed, that they are always visibly the result of a volition on the part of the leaf, meeting an external force or fate, to which it is never passively subjected. Upon it, as on a mineral in the course of formation, the great merciless influences of the universe, and the oppressive powers of minor things immediately near it, act continually. Heat and cold, gravity and the other attractions, windy pressure, or local and unhealthy restraint, must, in certain inevitable degrees, affect the whole of its life. But it is *life* which they affect;—a life of progress and will,—not a merely passive accumulation of substance. This may be seen by a single glance. The mineral—suppose an agate in the course of formation—shows in every line nothing but a dead submission to surrounding force. Flowing, or congealing, its substance is here repelled, there attracted, unresistingly to its place, and its languid sinuosities follow the clefts of the rock that contains them, in servile deflexion and compulsory cohesion, impotently calculable, and cold. But the leaf, full of fears and affections, shrinks and seeks, as it obeys. Not thrust, but awed into its retiring; not dragged, but won to its advance; not bent aside, as by a bridle, into new courses of growth: but persuaded and converted through tender continuance of voluntary change.

§ 18. The mineral and it differing thus widely in separate being, they differ no less in modes of companionship. The mineral crystals group themselves neither in succession, nor in sympathy; but great and small recklessly strive for place, and deface or distort each other as they gather into opponent asperities. The confused crowd fills the rock cavity, hanging together in a glittering, yet sordid heap, in which nearly every crystal, owing to their vain contention, is imperfect, or impure. Here and there one, at the cost and in defiance of the rest, rises into unwarped shape or unstained clearness. But the order of the leaves is one of soft and subdued concession. Patiently each awaits its appointed time, accepts its prepared place, yields its required observance. Under

every oppression of external accident, the group yet follows a law laid down in its own heart ; and all the members of it, whether in sickness or health, in strength or languor, combine to carry out this first and last heart law ; receiving, and seeming to desire for themselves and for each other, only life which they may communicate, and loveliness which they may reflect.

CHAPTER V

LEAF ASPECTS

§ 1. BEFORE following farther our inquiry into tree structure, it will rest us, and perhaps forward our work a little, to make some use of what we know already.

It results generally from what we have seen, that any group of four or five leaves, presenting itself in its natural position to the eye, consists of a series of forms connected by exquisite and complex symmetries, and that these forms will be not only varied in themselves, but every one of them seen under a different condition of foreshortening.

The facility of drawing the group may be judged of by a comparison. Suppose five or six boats, very beautifully built, and sharp in the prow, to start all from one point, and the first bearing up into the wind, the other three or four to fall off from it in succession an equal number of points,* taking each, in consequence, a different slope of deck from the stem of the sail. Suppose, also, that the bows of these boats were transparent, so that you could see the under sides of their decks, as well as the upper;—and that it were required of you to draw all their five decks, the under or upper side, as their curve showed it, in true foreshortened perspective, indicating the exact distance each boat had reached at a given moment from the central point they started from.

If you can do that, you can draw a rose-leaf. Not otherwise.

§ 2. When, some few years ago, the pre-Raphaelites began to lead our wandering artists back into the eternal

* I don't know that this is rightly expressed, but the meaning will be understood.

paths of all great Art, and showed that whatever men drew at all, ought to be drawn accurately and knowingly; not blunderingly nor by guess (leaves of trees, among other things): as ignorant pride on the one hand refused their teaching, ignorant hope caught at it on the other. "What!" said many a feeble young student to himself. "Painting is not a matter of science then, nor of supreme skill, nor of inventive brain. I have only to go and paint the leaves of the trees as they grow, and I shall produce beautiful landscapes directly."

Alas! my innocent young friend. "Paint the leaves as they grow!" If you can paint *one* leaf, you can paint the world.¹ These pre-Raphaelite laws, which you think so light, lay stern on the strength of Apelles and Zeuxis; put Titian to thoughtful trouble; are unrelaxed yet, and unrelaxable for ever. Paint a leaf indeed! Above-named Titian has done it: Correggio, moreover, and Giorgione: and Leonardo, very nearly, trying hard. Holbein, three or four times, in precious pieces, highest wrought. Raphael, it may be, in one or two crowns of Muse or Sibyl. If any one else, in later times, we have to consider.²

§ 3. At least until recently, the perception of organic leaf form was absolutely, in all painters whatsoever, proportionate to their power of drawing the human figure. All the great Italian designers drew leaves thoroughly well, though none quite so fondly as Correggio. Rubens drew them coarsely and vigorously,³ just as he drew limbs. Among the inferior Dutch painters, the leaf-painting degenerates in proportion to the diminishing power in figure. Cuyp, Wouvermans, and Paul Potter, paint better foliage than either Hobbima⁴ or Ruysdael.

¹ [So in *The Elements of Drawing*, § 42, "if you can draw the stone *rightly*, everything within the reach of art is also within yours" (Vol. XV. p. 49); and compare the lecture on "Tree Twigs," § 4; below, Appendix I. p. 469.]

² [For Titian's foliage, see below, § 8 n. For Correggio's, see below, § 5. Among the masters of leaf-painting Ruskin elsewhere includes Mantegna: see *Catalogue of the Educational Series*.]

³ [For his flowers, see below, ch. x. § 5.]

⁴ [For Hobbima's foliage, see Vol. III. pp. 592-593.]

§ 4. In like manner the power of treating vegetation in sculpture is absolutely commensurate with nobleness of figure design. The quantity, richness, or deceptive finish may be greater in third-rate work; but in true understanding and force of arrangement the leaf and the human figure show always parallel skill. The leaf-mouldings of Lorenzo Ghiberti are unrivalled, as his bas-reliefs are, and the severe foliage of the Cathedral of Chartres is as grand as its queen-statues¹

§ 5. The greatest draughtsmen draw leaves, like everything else, of their full life-size in the nearest part of the picture. They cannot be rightly drawn on any other terms. It is impossible to reduce a group so treated without losing much of its character; and more painfully impossible to represent by engraving any good workman's handling. I intended to have inserted in this place an engraving of the cluster of oak-leaves above Correggio's Antiope in the Louvre,² but it is too lovely; and if I am able to engrave it at all, it must be separately, and of its own size. So I draw roughly, instead, a group of oak-leaves on a young shoot, a little curled with autumn frost: Plate 53. I could not draw them accurately enough if I drew them in spring. They would droop and lose their relations. Thus roughly drawn, and losing some of their grace, by withering, they, nevertheless, have enough left to show how noble leaf form is; and to prove, it seems to me, that Dutch draughtsmen do not wholly express it. For instance, Fig. 3, Plate 54, is a facsimile of a bit of the nearest oak foliage out of Hobbima's Scene with the Water-mill, No. 131, in the Dulwich Gallery.³ Compared with the real forms of oak-leaf, in Plate 53, it may, I hope, at least enable my readers to

¹ [For Ghiberti, see Vol. VIII. pp. 149, 154; and for the queen-statues of Chartres, *Two Paths*, § 35 (Vol. XVI. p. 280, and Plate XV.).]

² [For other references to this picture, see below, p. 117; Vol. V. p. 93; Vol. X. p. 227; Vol. XII. pp. 145, 472; Vol. XV. p. 192; and below, pp. 117, 179.]

³ [Now No. 87; "Woody Landscape with a Large Water-Mill"; for other references to the picture, see below, ch. viii. § 12 n., and Vol. III. p. 524 (§ 18).]

understand, if they choose, why, never having ceased to rate the Dutch painters for their meanness or minuteness, I yet accepted the leaf-painting of the pre-Raphaelites with reverence and hope.

§ 6. No word has been more harmfully misused than that ugly one of "niggling." I should be glad if it were entirely banished from service and record.¹ The only essential question about drawing is whether it be right or wrong; that it be small or large, swift or slow, is a matter of convenience only. But so far as the word may be legitimately used at all, it belongs especially to such execution as this of Hobbima's²—execution which substitutes, on whatever scale, a mechanical trick or habit of hand for true drawing of known or intended forms. So long as the work is thoughtfully directed, there is no niggling. In a small Greek coin³ the muscles of the human body are as grandly treated as in a colossal statue; and a fine vignette of Turner's will show separate touches often more extended in intention, and stronger in result, than those of his largest oil pictures. In the vignette of the picture of Ginevra,⁴ at page 96 of Rogers's *Italy*, the forefinger touching the lip is entirely and rightly drawn, bent at the two joints, within the length of the thirtieth of an inch, and the whole hand within the space of one of those "niggling" touches of Hobbima. But if this work were magnified, it would be seen to be a strong and simple expression of a hand by thick black lines.

§ 7. Niggling, therefore, essentially means disorganized and mechanical work, applied on a scale which may deceive a vulgar or ignorant person into the idea of its being true: a definition applicable to the whole of the leaf-painting of the Dutch landscapists in distant effect, and for the most part to that of their near subjects also. Cuypp

¹ [Compare *Elements of Drawing*, § 16 (Vol. XV. p. 36).]

² [Ruskin had applied the word to him in the first volume of *Modern Painters*; see Vol. III. p. 339.]

Allen & Co. Jr.

54. Dutch Leafage.

and Wouvermans, as before stated, and others, in proportion to their power over the figure, drew leaves better in the foreground, yet never altogether well; for though Cuyp often draws a single leaf carefully (weedy ground-vegetation especially, with great truth), he never felt the connection of leaves, but scattered them on the boughs at random. Fig. 1 in Plate 54 is nearly a *facsimile* of part of the branch on the left side in our National Gallery picture.¹ Its entire want of grace and organization ought to be felt at a glance, after the work we have gone through. The average conditions of leafage-painting among the Dutch are better represented by Fig. 2, Plate 54, which is a piece of the foliage from the Cuyp in the Dulwich Gallery, No. 163.² It is merely wrought with a mechanical play of brush in a well-trained hand, gradating the colour irregularly and agreeably, but with no more feeling or knowledge of leafage than a paper-stainer shows in graining a pattern. A bit of the stalk is seen on the left; it might just as well have been on the other side, for any connection the leaves have with it. As the leafage retires into distance, the Dutch painters merely diminish their *scale* of touch. The touch itself remains the same, but its effect is falselier; for though the separate stains or blots in Fig. 2 do not rightly represent the forms of leaves, they may not inaccurately represent the number of leaves on that spray. But in distance, when, instead of one spray, we have thousands in sight, no human industry, nor possible diminution of touch, can represent their mist of foliage, and the Dutch work becomes doubly base, by reason of false form, and lost infinity.

§ 8. Hence what I said in our first inquiry about foliage. "A single dusty roll of Turner's brush is more truly expressive of the infinitude of foliage than the niggling of Hobbima could have rendered his canvas, if he had worked

¹ [No. 53 : "An Evening Landscape"; for another reference to the picture, see Vol. III. p. 272.]

² [Now No. 124 : "A Road near a River."]]

on it till doomsday.”¹ And this brings me to the main difficulty I have had in preparing this section. That infinitude of Turner’s execution attaches not only to his distant work, but in due degree to the nearest pieces of his trees. As I have shown in the chapter on mystery,² he perfected the system of art, as applicable to landscape, by the introduction of this infiniteness. In other qualities he is often only equal, in some inferior, to great preceding painters; but in this mystery he stands alone. He could not paint a cluster of leaves better than Titian;³ but he could a bough, much more a distant mass of foliage. No man ever before painted a distant tree rightly, or a full-leaved branch rightly. All Titian’s distant branches are ponderous flakes, as if covered with seaweed, while Veronese’s and Raphael’s are conventional, being exquisitely ornamental arrangements of small perfect leaves. See the background of the Parnassus in Volpato’s plate.⁴ It is very lovely, however.

§ 9. But this peculiar execution of Turner’s is entirely uncopyable; least of all to be copied in engraving. It is at once so dexterous and so keenly cunning, swiftest play of hand being applied with concentrated attention on every movement, that no care in facsimile will render it. The delay in the conclusion of this work has been partly caused by the failure of repeated attempts to express this execution. I see my way now to some partial result; but must get the writing done, and give undivided care to it before I attempt to produce costly plates.⁵ Meanwhile, the little cluster of foliage opposite, from the thicket which runs up the bank on the right-hand side of the drawing of

¹ [*Modern Painters*, vol. i. (Vol. III. p. 339).]

⁴ [Giovanni Volpato (1733-1803), draughtsman and engraver, was the principal artist employed on a set of coloured prints from the works of Raphael in the Vatican. For references to the Parnassus in other connexions, see Vol. XII. pp. 148-149, and n.]

⁵ [See above, p. 8; and compare Vol. VI. pp. 3-4.]

Richmond, looking up the river, in the Yorkshire series,¹ will give the reader some idea of the mingled definiteness and mystery of Turner's work, as opposed to the mechanism of the Dutch on the one side, and the conventional severity of the Italians on the other. It should be compared with the published engraving in the Yorkshire series; for just as much increase, both in quantity and refinement, would be necessary in every portion of the picture, before any true conception could be given of the richness of Turner's designs. A fragment of distant foliage I may give farther on;² but, in order to judge rightly of either example, we must know one or two points in the structure of branches, requiring yet some irksome patience of inquiry, which I am compelled to ask the reader to grant me through another two chapters.

¹ [For particulars of this drawing see the entry, "Richmond, from the Banks of the River," in Index I. of Vol. XIth. (p. 604).]

² [See below, Figs. 56 and 63.]

CHAPTER VI

THE BRANCH

§ 1. WE have hitherto spoken of each shoot as either straight or only warped by its spiral tendency; but no shoot of any length, except those of the sapling, ever can be straight; for, as the family of leaves which it bears are forced unanimously to take some given direction in search of food or light, the stalk necessarily obeys the same impulse, and bends itself so as to sustain them in their adopted position, with the greatest ease to itself and comfort for them.

In doing this, it has two main influences to comply or contend with: the first, the direct action of the leaves in drawing it this way or that, as they themselves seek particular situations; the second, the pressure of their absolute weight after they have taken their places, depressing each bough in a given degree; the leverage increasing as the leaf extends. To these principal forces may frequently be added that of some prevalent wind, which, on a majority of days in the year, bends the bough, leaves and all, for hours together, out of its normal position. Owing to these three forces, the shoot is nearly sure to be curved in at least two directions;* that is to say, not merely as the rim of a wine-glass is curved (so that, looking at it horizontally, the circle becomes a straight line), but as the edge of a lip or an eyebrow is curved, partly upwards, partly forwards, so that in no possible perspective can it be seen as a straight line. Similarly, no perspective will usually bring a shoot of a free-growing tree to appear a straight line.

* See the note on Fig. 11, at page 31, which shows these two directions in a shoot of lime.

§ 2. It is evident that the more leaves the stalk has to sustain, the more strength it requires. It might appear, therefore, not unadvisable that every leaf should, as it grew, pay a small tax to the stalk for its sustenance; so that there might be no fear of any number of leaves being too oppressive to their bearer. Which, accordingly, is just what the leaves do. Each, from the moment of his complete majority, pays a stated tax to the stalk; that is to say, collects for it a certain quantity of wood, or materials for wood, and sends this wood, or what ultimately will become wood, *down* the stalk to add to its thickness.

§ 3. "Down the stalk?" yes, and down a great way farther. For as the leaves, if they did not thus contribute to their own support, would soon be too heavy for the spray, so if the spray, with its family of leaves, contributed nothing to the thickness of the branch, the leaf-families would soon break down their sustaining branches. And, similarly, if the branches gave nothing to the stem, the stem would soon fall under its boughs. Therefore by a power of which I believe no sufficient account exists,* as each leaf adds to the thickness of the shoot, so each shoot to the branch, so each branch to the stem, and that with so perfect an order and regularity of duty, that from every leaf in all the countless crowd at the tree's summit, one

* I find that the office and nature of cambium, the causes of the action of the sap, and the real mode of the formation of buds, are all still under the investigation of botanists.¹ I do not lose time in stating the doubts or probabilities which exist on these subjects. For us, the mechanical fact of the increase of thickness by every leaf's action is all that needs attention. The reader who wishes for information as accurate as the present state of science admits, may consult Lindley's *Introduction to Botany*,² and an interesting little book by Dr. Alexander Harvey on *Trees and their Nature* (Nisbet and Co., 1856), to which I owe much help.

¹ [Compare the lecture on "Tree Twigs," below, p. 467.]

² [By John Lindley, F.R.S., 2 vols., 1848. For a reference to standard works of a later date, see above, p. lix. The full title of the other book referred to is *Trees and their Nature; or, The Bud and its Attributes. In a Series of Letters to his Sons.* Alexander Harvey, M.D.]

slender fibre, or at least fibre's thickness of wood, descends through shoot, through spray, through branch, and through stem; and having thus added, in its due proportion, to form the strength of the tree, labours yet farther and more painfully to provide for its security; and thrusting forward into the root, loses nothing of its mighty energy until, mining through the darkness, it has taken hold in cleft of rock or depth of earth, as extended as the sweep of its green crest in the free air.

§ 4. Such at least is the mechanical aspect of the tree. The work of its construction, considered as a branched tower, partly propped by buttresses, partly lashed by cables, is thus shared in by every leaf. But considering it as a living body to be nourished, it is probably an inaccurate analogy to speak of the leaves being taxed for the enlargement of the trunk. Strictly speaking, the trunk enlarges by sustaining them. For each leaf, however far removed from the ground, stands in need of nourishment derived from the ground, as well as of that which it finds in the air; and it simply sends its root down along the stem of the tree, until it reaches the ground and obtains the necessary mineral elements. The trunk has been therefore called by some botanists a "bundle of roots," but I think inaccurately. It is rather a messenger to the roots.* A root, properly so called, is a fibre, spongy or absorbent at the extremity, which secretes certain elements from the earth. The stem is by this definition no more a cluster of roots than a cluster of leaves, but a channel of intercourse between the roots and the leaves. It can gather no nourishment. It only carries nourishment, being, in fact, a group of canals for the conveyance of marketable commodities, with an electric telegraph attached to each,

* In the true sense, "a mediator" (*μεσίτης*).¹

¹ [See, in the Greek Testament, 1 Timothy ii. 5: "one mediator (*μεσίτης*) between God and men."]

transmitting messages from leaf to root, and root to leaf, up and down the tree. But whatever view we take of the operative causes, the external and visible fact is simply that every leaf does send down from its stalk a slender thread of woody matter along the sides of the shoot it grows upon; and that the increase of thickness in stem, proportioned to the advance of the leaves, corresponds with an increase of thickness in roots, proportioned to the advance of their outer fibres. How far interchange of elements takes place between root and leaf, it is not our work here to examine; the general and broad idea is this, that the whole tree is fed partly by the earth, partly by the air; strengthened and sustained by the one, agitated and educated by the other; all of it which is best, in substance, life, and beauty, being drawn more from the dew of heaven than the fatness of the earth.¹ The results of this nourishment of the bough by the leaf in external aspect, are the object of our immediate inquiry.

§ 5. Hitherto we have considered the shoot as an ascending body, throwing off buds at intervals. This it is indeed; but the part of it which ascends is not seen externally. Look back to Plate 51. You will observe that each shoot is furrowed,² and that the ridges between the furrows rise in slightly spiral lines, terminating in the armlets under the buds which bore last year's leaves. These ridges, which rib the shoot so distinctly, are not on the ascending part of it. They are the contributions of each successive leaf thrown out as it ascended. Every leaf sent down a slender cord, covering and clinging to the shoot beneath, and increasing its thickness. Each, according to his size and strength, wove his little strand of cable, as a spider his thread; and cast it down the side of the springing tower by a marvellous magic—irresistible! The fall of a granite pyramid from an Alp may perhaps be stayed; the descending force of that silver thread shall not be stayed. It will split the rocks

¹ [Genesis xxvii. 28.]

² [Ruskin in his own copy has marked § 5 for revision.]

themselves at its roots, if need be, rather than fail in its work.

So many leaves, so many silver cords. Count—for by just the thickness of one cord, beneath each leaf, let fall in fivefold order round and round, the shoot increases in thickness to its root:—a spire built downwards from the heaven.

And now we see why the leaves dislike being above each other.¹ Each seeks a vacant place, where he may freely let fall the cord. The turning aside of the cable to avoid the buds beneath, is one of the main causes of spiral curvature, as the shoot increases. It required all the care I could give to the drawing, and all Mr. Armytage's skill in engraving Plate 51, to express, though drawing them nearly of their full size, the principal courses of curvature in even this least graceful of trees.

§ 6. According to the structure thus ascertained, the body of the shoot may at any point be considered as formed by a central rod, represented by the shaded inner circle, *a*, Fig. 36, surrounded by as many rods of descending external wood as there are leaves above the point where the section is made. The first five leaves above send down the first dark rods; and the next above send down those between, which, being from younger leaves, are less, but yet fill the interstices; then the third group sending down the smallest, it will be seen at a glance how a spiral action is produced. But it would lead us into too subtle

Fig. 36

detail if I traced the forces of this gradual superimposition. I must be content to let the reader pursue this part of the subject for himself, if it amuses him, and proceed to larger questions.

§ 7. Broadly and practically, we may consider the whole cluster of woody material in Fig. 36 as one circle of fibrous substance formed round a small central rod. The real

¹ [See above, p. 30.]

appearance in most trees is approximately as in *b*, Fig. 36, the radiating structure becoming more distinct in proportion to the largeness and compactness of the wood.*

Now the next question is, how this descending external coating of wood will behave itself when it comes to the forking of the shoots. To simplify the examination of this, let us suppose the original or growing shoot (whose section is the shaded inner circle in Fig. 36) to have been in the form of a letter Y, and no thicker than a stout iron wire, as in Fig. 37. Down the arms of this letter Y, we have two fibrous streams running in the direction of the arrows. If the depth or

Fig. 37

Fig. 38

thickness of these streams be such as at *b* and *c*, what will their thickness be when they unite at *e*? Evidently, the quantity of wood surrounding the vertical wire at *e* must be twice as great as that surrounding the wires *b* and *c*.

§ 8. The reader will, perhaps, be good enough to take it on my word (if he does not know enough of geometry to ascertain), that the large circle, in Fig. 38, contains twice as much area as either of the two smaller circles. Putting these circles in position, so as to guide us, and supposing the trunk to be bounded by straight lines, we have for the outline of the fork that in Fig. 38.

How, then, do the two minor circles change into one large one? The section of the stem at *a* is a circle; and at *b*, is a circle; and at *c*, a circle. But what is it at *e*? Evidently, if the two circles merely united gradually, without change of form through a series of figures, such as

* The gradual development of this radiating structure, which is organic and essential, composed of what are called by botanists medullary rays, is still a great mystery and wonder to me.

those at the top of Fig. 39, the quantity of wood, instead of remaining the same, would diminish from the contents of two circles to the contents of one. So for every loss, which the circles sustain at this junction, an equal quantity of wood must be thrust out somehow to the side. Thus, to enable the circles to run into each other, as far as shown at *b*, in Fig. 39, there must be a loss between them of as much wood as the shaded space. Therefore, half of that space must be added, or rather pushed out on each side, and the section of the uniting branch becomes approxi-

Fig. 39

mately as in *c*, Fig. 39; the wood squeezed out encompassing the stem more as the circles close, until the whole is reconciled into one larger single circle.

§ 9. I fear the reader would have no patience with me, if I asked him to examine, in longitudinal section, the lines of the descending currents of wood as they eddy into the increased single river. Of course, it is just what would take place if two strong streams, filling each a cylindrical pipe, ran together into one large cylinder, with a central rod passing up every tube. But, as this central rod increases, and, at the same time, the supply of the stream from above, every added leaf contributing its little current, the eddies of wood about the fork become intensely curious and interesting; of which thus much the reader may observe in a

moment by gathering a branch of any tree (*laburnum* shows it better, I think, than most), that the two meeting currents, first wrinkling a little, then rise in a low wave in the hollow of the fork, and flow over at the side, making their way to diffuse themselves round the stem, as in Fig. 40. Seen laterally, the bough bulges out below the fork, rather curiously and awkwardly, especially if more than two boughs meet at the same place, growing in one plane, so as to show the sudden increase on the profile. If the reader is interested in the subject, he will find strangely complicated and wonderful arrangements of stream when smaller boughs meet larger (one example is given in Plate 3, Vol. III.,¹ where the current of a smaller bough, entering upwards, pushes its way into the stronger rivers of the stem). But I cannot, of course, enter into such detail here.

§ 10. The little ringed accumulation, repelled from the wood of the larger trunk at the base of small boughs, may be seen at a glance in any tree, and needs no illustration; but I give one from *Salvator*, Fig. 41 (from his own etching, *Democritus omnium Derisor*),² which is interesting, because it shows the swelling at the bases of insertion, which yet, *Salvator's* eye not being quick enough to detect the law of descent in the fibres, he, with his usual love of ugliness, fastens on this swollen character,

Fig. 41

¹ ["Strength of Old Pine": Vol. V. p. 159.]

² [Ruskin's MS. shows that he had intended to contrast this Fig. 41 with one from Turner's *Liber Studiorum*—namely, the "*Æsacus and Hesperie*" (now reproduced in *Lectures on Landscape*):—

"I will anticipate our examination of branch aspects so far as to take a single example of junction of boughs from the etching of *Æsacus and Hesperie*. It shows at once the projection at the root of two minor boughs, highest on left, and the way their wood runs down the trunk, spreading round it as it descends. At the lower fork, where a large branch has been broken away, the size of it is told by the accumulation of the overflowing wave of wood; and at the bottom the little ringed projections are seen at the bases of minor branches joining the main stem. A magnificent example is given further on from the pollard willow."

For the pollard willow, see below, Fig. 61, p. 92.]

and exaggerates it into an appearance of disease. The same

Fig. 41

Fig. 42

bloated aspect may be seen in the example already given from another etching, Vol. III., Plate 4, Fig. 8.¹

¹ [From Salvator's "Finding of Œdipus": Vol. V. p. 159, and the Plate facing p. 160.]

§ 11. I do not give any more examples from Claude. We have had enough already in Plate 4, Vol. III., which the reader should examine carefully. If he will then look

Fig. 43

forward to Fig. 61 here [p. 92], he will see how Turner inserts branches, and with what certain and strange instinct of fidelity he marks the wrinkled enlargement and sinuous eddies of the wood rivers where they meet.

And remember always that Turner's greatness and rightness in all these points successively depend on no scientific knowledge.¹ He was entirely ignorant of all the laws we have been developing. He had merely accustomed himself to see impartially, intensely, and fearlessly.

§ 12. It may, perhaps, be interesting to compare, with the rude fallacies of Claude and Salvator, a little piece of earliest art, wrought by men who could see and feel. The scroll, Fig. 42, is a portion of that which surrounds the arch in San Zeno of Verona, above the pillar engraved in the *Stones of Venice*, Plate 17, Vol. I.² It is, therefore, twelfth, or earliest thirteenth-century work. Yet the foliage is already full of spring and life; and in the part of the stem, which I have given of its real size in Fig. 43, the reader will perhaps be surprised to see at the junctions the laws of vegetation, which escaped the sight of all the degenerate landscape-painters of Italy, expressed by one of her simple architectural workmen six hundred years ago.

We now know enough, I think, of the internal conditions which regulate tree-structure to enable us to investigate, finally, the great laws of branch and stem aspect. But they are very beautiful; and we will give them a separate chapter.

¹ [For a similar remark upon Turner's geological accuracy, see note at Vol. III. p. 429.]

² [In this edition, Vol. IX. p. 383.]

CHAPTER VII

THE STEM¹

§ 1. WE must be content, in this most complex subject, to advance very slowly; and our easiest, if not our only way, will be to examine, first, the conditions under which boughs would form, supposing them all to divide in one plane, as your hand divides when you lay it flat on the table, with the fingers as wide apart as you can. And then we will deduce the laws of ramification which follow on the real structure of branches, which truly divide, not in one plane, but as your fingers separate if you hold a large round ball with them.

The reader has, I hope, a clear idea by this time of the main principle of tree-growth; namely, that the increase is by addition, or superimposition, not extension. A branch does not stretch itself out as a leech stretches its body. But it receives additions at its extremity, and proportional additions to its thickness. For although the actual living shoot, or growing point, of any year, lengthens itself gradually until it reaches its terminal bud, after that bud is formed, its length is fixed. It is thenceforth one joint of the tree, like the joint of a pillar, on which other joints of marble may be laid to elongate the pillar, but which will not itself stretch. A tree is thus truly edified, or built, like a house.

§ 2. I am not sure with what absolute stringency this law is observed, or what slight lengthening of substance may be traceable by close measurement among inferior branches.

¹ [With this chapter Ruskin's lecture on "Tree Twigs" should be compared; see below, Appendix I., pp. 467 *seq.*]

For practical purposes, we may assume that the law is final, and that if we represent the state of a plant, or extremity of branch, in any given year under the simplest possible type, Fig. 44, *a*, of two shoots, with terminal buds, springing from one stem, its growth next year may be expressed by the type, Fig. 44, *b*, in which, the original stems not changing or increasing, the terminal buds have built up each another story of plant, or repetition of the original form; and, in order to support this new edifice, have sent down roots all the way to the ground, so as to enclose and thicken the inferior stem.

Fig. 44

But if this is so, how does the original stem, which never lengthens, ever become the tall trunk of a tree? The arrangement just stated provides very satisfactorily for making it stout, but not for making it tall. If the ramification proceeds in this way, the tree must assuredly become a round compact ball of short sticks, attached to the ground by a very stout, almost invisible, stem, like a puff-ball.

For if we take the form above, on a small scale, merely to see what comes of it, and carry its branching three steps farther, we get the successive conditions in Fig. 45, of which the last comes already round to the ground.

"But those forms really look something like trees!" Yes, if they were on a large scale. But each of the little shoots is only six or seven inches long; the whole cluster would but be three or four feet over, and touches the ground already at its extremity. It would enlarge if it went on growing, but never rise from the ground.

§ 3. This is an interesting question: one, also, which, I fear, we must solve, so far as yet it can be solved, with little help. Perhaps nothing is more curious in the history of human mind than the way in which the science of

botany has become oppressed by nomenclature.¹ Here is perhaps the first question which an intelligent child would think of asking about a tree: "Mamma, how does it make its trunk?" and you may open one botanical work after another, and good ones too, and by sensible men,—you shall not find this child's question fairly put, much less fairly answered. You will be told gravely that a stem has received many names, such as *culmus*, *stipes*, and *truncus*; that twigs were once called *flagella*, but are now called *ramuli*; and that Mr. Link² calls a straight stem, with branches on its sides, a *caulis excurrentis*; and a stem, which at a certain distance above the earth breaks out into

Fig. 45

irregular ramifications, a *caulis deliquescentis*. All thanks and honour be to Mr. Link! But at this moment, when we want to know *why* one stem breaks out "at a certain distance," and the other not at all, we find no great help in those splendid excurrenties and deliquescenties. "At a certain distance?" Yes: but why not before? or why then? How was it that, for many and many a year, the young shoots agreed to construct a vertical tower, or, at least, the nucleus of one, and then, one merry day, changed their minds, and built about their metropolis in all directions, nobody knows where, far into the air in free delight? How is it that yonder larch-stem grows straight and true, while its branches, constructed by the same process as the mother trunk, and under the mother trunk's careful inspection and direction, nevertheless have lost all their manners, and go forking and flashing about, more like

¹ [Compare *Lectures on Art*, § 106; and Introduction to *Proserpina*.]

² [Heinrich Friedrich Link (1767–1851), Professor of Natural History and Director of the Botanical Garden at Berlin; author of numerous works on Botany.]

cracklings of spitefullest lightning than gentle branches of trees that dip green leaves in dew?

§ 4. We have probably, many of us, missed the point of such questions as these, because we too readily associated the structure of trees with that of flowers. The flowering part of a plant shoots out or up, in some given direction, until, at a stated period, it opens or branches into perfect form by a law just as fixed, and just as inexplicable, as that which numbers the joints of an animal's skeleton, and puts the head on its right joint. In many forms of flowers—foxglove, aloe, hemlock, or blossom of maize—the structure of the flowering part so far assimilates itself to that of a tree, that we not unnaturally think of a tree only as a large flower, or large remnant of flower, run to seed. And we suppose the time and place of its branching to be just as organically determined as the height of the stalk of straw, or hemlock pipe, and the fashion of its branching just as fixed as the shape of petals in a pansy or cowslip.

§ 5. But that is not so; not so in anywise. So far as you can watch a tree, it is produced throughout by repetitions of the same process, which repetitions, however, are arbitrarily directed so as to produce one effect at one time, and another at another time. A young sapling has his branches as much as the tall tree. He does not shoot up in a long thin rod, and begin to branch when he is ten or fifteen feet high, as the hemlock or foxglove does when each has reached its ten or fifteen inches. The young sapling conducts himself with all the dignity of a tree from the first;—only he so manages his branches as to form a support for his future life, in a strong straight trunk, that will hold him well off the ground. Prudent little sapling!—but how does he manage this? how keep the young branches from rambling about, till the proper time, or on what plea dismiss them from his service if they will not help his provident purpose? So again, there is no difference in mode of construction between the trunk of a pine and its

branch. But external circumstances so far interfere with the results of this repeated construction, that a stone pine rises for a hundred feet like a pillar, and then suddenly bursts into a cloud. It is the knowledge of the mode in which such change may take place which forms the true natural history of trees;—or, more accurately, their moral history. An animal is born with so many limbs, and a head of such a shape. That is, strictly speaking, not its history, but one fact in its history: a fact of which no other account can be given than that it was so appointed. But a tree is born without a head. It has got to make its own head. It is born like a little family from which a great nation is to spring; and at a certain time, under peculiar external circumstances, this nation, every individual of which remains the same in nature and temper, yet gives itself a new political constitution, and sends out branch colonies, which enforce forms of law and life entirely different from those of the parent state. That is the history of the state. It is also the history of a tree.

§ 6. Of these hidden histories, I know and can tell you as little as I did of the making of rocks.¹ It will be enough for me if I can put the difficulty fairly before you, show you clearly such facts as are necessary to the understanding of great Art, and so leave you to pursue, at your pleasure, the graceful mystery of this imperfect leafage life.

I took in the outset² the type of a *triple* bud as the most general that could be given of all trees, because it represents a prevalently upright main tendency, with a capacity of branching on both sides. I would have shown the power of branching on *all* sides if I could; but we must be content at first with the simplest condition. From what we have seen since of bud structure, we may now make our type more complete by giving each bud a root proportioned to its size. And our elementary type of tree plant will be as in Fig. 46.

¹ [See Vol. VI. p. 146.]

² [See above, p. 24.]

§ 7. Now these three buds, though differently placed, have all one mind. No bud has an oblique mind. Every one would like, if he could, to grow upright, and it is because the midmost one has entirely his own way in this matter, that he is largest. He is an elder brother;—his birthright is to grow straight towards the sky. A younger child may perhaps supplant him, if he does not care for his privilege. In the meantime all are of one family, and love each other,—

Fig. 46

so that the two lateral buds do not stoop aside because they like it, but to let their more favoured brother grow in peace. All the three buds and roots have at heart the same desire;—which is, the one to grow as straight as he can towards bright heaven, the other as deep as he can into dark earth.

Up to light and down to shade;—into air and into rock:—that is their mind and purpose for ever. So far as they can, in kindness to each other, and by sufferance of external circumstances, work out that destiny, they will. But their beauty will not result from their working it out,—only from their maintained purpose and resolve to do so, if it may be. They will fail—certainly two, perhaps all three of them: fail egregiously;—ridiculously;—it may be, agonizingly. Instead of growing up, they may be wholly sacrificed to happier buds above, and have to grow *down*, sideways, roundabout ways, all sorts of ways. Instead of getting down quietly into the convent of the earth, they may have to cling and crawl about hardest and hottest angles of it, full in sight of man and beast, and roughly trodden under foot by them;—stumbling-blocks to many.

Yet out of such sacrifice, gracefully made—such misfortune, gloriously sustained—all their true beauty is to arise. Yes, and from more than sacrifice—more than misfortune: from *death*. Yes, and more than death: from the worst kind of death: not natural, coming to each in its due time; but premature, oppressed, unnatural, misguided—or so it would seem—to the poor dying sprays. Yet, without such death, no strong trunk were ever possible; no grace of

glorious limb or glittering leaf; no companionship with the rest of nature or with man.

§ 8. Let us see how this must be. We return to our poor little threefold type, Fig. 46, above. Next year he will become as in Fig. 47. The two lateral buds keeping as much as may be out of their brother's way, and yet growing upwards with a will, strike diagonal lines, and in moderate comfort accomplish their year's life and terminal buds. But what is to be done next? Forming the triple terminal head on this diagonal line, we find that one of our next year's buds, *c*, will have to grow down again, which is very hard; and another, *b*, will run right against the lateral branch of the upper bud, *A*, which must not be allowed under any circumstances.

Fig. 47

What are we to do?

§ 9. The best we can. Give up our straightness, and some of our length, and consent to grow short, and crooked.

Fig. 48

Bud *b* shall be ordered to stoop forward and keep his head out of the great bough's way, as in Fig. 48, and grow as he best may, with the consumptive pain in his chest. To give him a little more room, the elder brother, *a*, shall stoop a little forward also, recovering himself when he has got out of *b*'s way; and bud *c* shall be encouraged to bend himself bravely round and up, after his first start in that disagreeable downward direction. Poor *b*, withdrawn from air and light between *a* and *A*, and having to live stooping besides, cannot make much of himself, and is stunted and feeble; *c*, having free play for his energies, bends up with a will, and becomes handsomer, to our minds, than if he had been straight, and *a* is none the worse for his concession to unhappy *b* in early life.

So far well for this year. But how for next? *b* is already too near the spray above him, even for his own strength and comfort; much less, with his weak constitution, will he be able to throw up any strong new shoots. And if he did, they would only run into those of the bough above. (If the reader will proceed in the construction of the whole figure he will see that this is so.) Under these discouragements and deficiencies, *b* is probably frost-bitten, and drops off. The bough proceeds, mutilated, and itself

Fig. 49

somewhat discouraged.

But it repeats its sincere and good-natured compliances, and at the close of the year, new wood from all the leaves having concealed the stump, and effaced the memory of poor lost *b*, and perhaps a consolatory bud lower down having thrown out a tiny spray to make the most of the vacant space

near the main stem, we shall find the bough in some such shape as Fig. 49.

§ 10. Wherein we already see the germ of our irregularly bending branch, which might ultimately be much the prettier for the loss of *b*. Alas! the Fates have forbidden even this. While the low bough is making all these exertions, the boughs of *A*, above him, higher in air, have made the same under happier auspices. Every year their thicker leaves more and more forbid the light; and, after rain, shed their own drops unwittingly on the unfortunate lower bough, and prevent the air or sun from drying his bark or checking the chill in his medullary rays. Slowly a hopeless languor gains upon him. He buds here or there, faintly, in the spring; but the flow of strong wood from above oppresses him even about his root, where it joins the

trunk. The very sap does not turn aside to him, but rushes up to the stronger, laughing leaves far above. Life is no more worth having; and abandoning all effort, the poor bough drops, and finds consummation of destiny in helping an old woman's fire.

When he is gone, the one next above is left with greater freedom, and will shoot now from points of its sprays which were before likely to perish. Hence another condition of irregularity in form. But that bough also will fall in its turn, though after longer persistence. Gradually thus the central trunk is built, and the branches by whose help it was formed cast off, leaving here and there scars, which are all effaced by years, or lost sight of among the roughness and furrows of the aged surface. The work is continually advancing, and thus the head of foliage on any tree is not an expansion at a given height, like a flower-bell, but the collective group of boughs, or workmen, who have got up so far, and will get up higher next year, still losing one or two of their number underneath.

§ 11. So far well. But this only accounts for the formation of a vertical trunk. How is it that at a certain height this vertical trunk ceases to be built; and irregular branches spread in all directions?

First: In a great number of trees, the vertical trunk never ceases to be built. It is confused, at the top of the tree, among other radiating branches, being at first, of course, just as slender as they, and only prevailing over them in time. It shows at the top the same degree of irregularity and undulation as a sapling; and is transformed gradually into straightness lower down (see Fig. 50). The reader has only to take an hour's ramble, to see for himself how many trees are thus constructed, if circumstances are favourable to their growth. Again, the mystery of blossoming has great influence in increasing the tendency to dispersion among the upper boughs; but this part of vegetative structure I cannot enter into; it is too subtle, and has, besides, no absolute bearing on our subject; the principal conditions which

produce the varied play of branches being purely mechanical. The point at which they show a determined tendency to spread is generally to be conceived as a place of *rest* for the tree, where it has reached the height from the ground at which ground-mist, imperfect circulation of air, etc., have ceased to operate injuriously on it, and where it has free room, and air, and light for its growth.

§ 12. I find there is quite an infinite interest in watching the different ways in which trees part their sprays at this resting-place, and the sometimes abrupt, sometimes gentle and undiscoverable, severing of the upright stem into the wandering and wilful branches; but a volume, instead of a

chapter or two, and quite a little gallery of plates would be needed to illustrate the various grace of this division, associated as it is with an exquisitely subtle effacing of undulation in the thicker stems, by the flowing down of the wood from above; the curves which are too violent in the branches being filled up, so that what was as at *a*,

Fig. 50, becomes as at *b*, and when the main stem is old, passes at last into straightness by almost imperceptible curves, a continually gradated emphasis of curvature being carried to the branch extremities.

§ 13. Hitherto we have confined ourselves entirely to examination of stems in one plane. We must glance—though only to ascertain how impossible it is to do more than glance—at the conditions of form which result from the throwing out of branches, not in one plane, but on all sides. “As your fingers divide when they hold a ball,” I said:¹ or, better, a large cup, without a handle. Consider how such ramification will appear in one of the bud groups, that of our old friend the oak. We saw it opened usually into five shoots. Imagine then (Fig. 51), a five-sided cup or funnel with a stout rod running through the centre of

¹ [See above, § 1, p. 69.]

it. In the figure it is seen from above, so as partly to show the inside, and a little obliquely, that the central rod may not hide any of the angles. Then let us suppose that, where the angles of this cup were, we have, instead, five rods, as in Fig. 52, A, like the ribs of a pentagonal umbrella turned inside out by the wind. I dot the pentagon which connects their extremities, to keep their positions clear. Then these five rods, with the central one, will represent the five shoots, and the leader, from a vigorous young oak-spray. Put the leaves on each; the five-foiled star at its extremity, and the others, now not quite formally, but still on the whole as in Fig. 3 above [p. 26], and we have the result, Fig. 52, B—rather a pretty one.

Fig. 51

§ 14. By considering the various aspects which the five rods would take in Fig. 52, as the entire group was seen from below or above, and at different angles and distances, the reader may find out for himself what changes of aspect are possible in even so regular a structure as this. But the branchings soon take more complex symmetry. We know that next year each of these five subordinate rods is to enter into life on its own account, and to repeat the branching of the first. Thus, we shall have five pentagonal cups surrounding a large central pentagonal cup. This figure, if the reader likes a pretty perspective problem, he may construct for his own pleasure:—which having done, or conceived, he is then to apply the great principles of subjection and resilience, not to three branches only, as in Fig. 49, but to the five of each cup;—by which the cups get flattened out and bent up, as you may have seen vessels of Venetian glass, so that every cup actually takes something the shape of a thick aloe or artichoke leaf; and they surround the central one, not as a bunch of grapes surrounds

a grape at the end of it, but as the petals grow round the centre of a rose. So that any one of these lateral branches—though, seen from above, it would present a symmetrical figure, as if it were not flattened (A, Fig. 53)—seen sideways, or in profile, will show itself to be at least as much flattened as at B.

§ 15. You may thus regard the whole tree as composed of a series of such thick, flat, branch-leaves; only incom-

Fig. 52

parably more varied and enriched in framework as they spread; and arranged more or less in spirals round the trunk. Gather a cone of a Scotch fir; begin at the bottom of it, and pull off the seeds, so as to show one of the spiral rows of them continuously, from the bottom to the top, leaving enough seeds above them to support the row. Then the gradual lengthening of the seeds from the root, their spiral arrangement, and their limitation within a curved, convex form, furnish the best *severe* type you can have of the branch system of all stemmed trees; and each seed of the cone represents, not badly, the sort of flattened solid

leaf-shape which all complete branches have. Also, if you will try to draw the spiral of the fir-cone, you will understand something about tree-perspective, which may be generally useful. Finally, if you note the way in which the seeds of the cone slip each farther and farther over each other, so as to change sides in the middle of the cone, and obtain a reversed action of spiral lines in the upper half, you may imagine what a piece of work it would be for both of us, if we were to try to follow the complexities of branch order in trees of irregular growth, such as the rhododendron.

Fig. 53

I tried to do it, at least, for the pine, in section, but saw I was getting into a perfect maelström of spirals, from which no efforts would have freed me, in any imaginable time, and the only safe way was to keep wholly out of the stream.

§ 16. The alternate system, leading especially to the formation of forked trees, is more manageable; and if the reader is master of perspective, he may proceed some distance in the examination of that for himself. But I do not care to frighten the general reader by many diagrams: the book is always sure to open at them when he takes it up. I will venture on one which has perhaps something a little amusing about it, and is really of importance.

§ 17. Let X, Fig. 54, represent a shoot of any opposite-leaved tree. The mode in which it will grow into a tree

depends, mainly, on its disposition to lose the leader or a lateral shoot. If it keeps the leader, but drops the lateral, it takes the form A, and next year by a repetition of the process, B. But if it keeps the laterals, and drops the leader, it becomes, first, C, and next year, D. The form A is almost universal in spiral or alternate trees; and it is

Fig. 54

especially to be noted as bringing about this result, that in any given forking, one bough always goes on in its own direct course, and the other leaves it softly: they do not separate as if one was repelled from the other. Thus in Fig. 55, a perfect and nearly symmetrical piece of ramification, by Turner (lowest bough but one in the tree on the left in the “Château of La belle Gabrielle”¹), the leading bough,

Fig. 55

going on in its own curve, throws off, first, a bough to the right, then one to the left, then two small ones to the right, and proceeds itself, hidden by leaves, to form the farthest upper point of the branch.

The lower secondary bough—the first thrown off—proceeds in its own curve, branching first to left, then to right.

¹ [In the *Keepsake* for 1834; for another reference to the foliage in this drawing, see Vol. III. p. 587.]

J. Ernau.
André & Siegh. Sc.

56. Sketch by a Clerk of the Works.

J. Ruskin.

The upper bough proceeds in the same way, throwing off first to left, then to right. And this is the commonest and most graceful structure. But if the tree loses the leader, as at C, Fig. 54 (and many opposite trees have a trick of doing so), a very curious result is arrived at, which I will give in a geometrical form.

§ 18. The number of branches which die, so as to leave the main stem bare, is always greatest low down, or near the interior of the tree. It follows that the lengths of stem which do not fork diminish gradually to the extremities, in a fixed proportion. This is a general law. Assume, for example's sake, the stem to separate always into two branches, at an equal angle, and that each branch is three-quarters of the length of the preceding one. Diminish their thicknesses in proportion, and carry out the figure any extent you like. In Plate 56, opposite, Fig. 1,¹ you have it at its ninth branch; in which I wish you to notice, first, the delicate curve formed by every complete line of the branches (compare Vol. IV. Fig. 91²); and, secondly, the very curious result of the top of the tree being a broad flat line, which passes at an angle into lateral shorter lines, and so down to the extremities. It is this property which renders the contours of tops of trees so intensely difficult to draw rightly, without making their curves too smooth and insipid.

Observe, also, that the great weight of the foliage being thrown on the outside of each main fork, the tendency of forked trees is very often to droop and diminish the bough on one side, and erect the other into a principal mass.*

* This is Harding's favourite form of tree.³ You will find it much insisted on in his works on foliage. I intended to have given a figure to show the results of the pressure of the weight of all the leafage on a great lateral bough, in modifying its curves, the strength of timber being greatest where the leverage of the mass tells most. But I find nobody ever reads things which it takes any trouble to understand, so that it is of no use to write them.

¹ [For the references to Figs. 2 and 3 on this Plate, see below, pp. 155-156.]

² [In this edition, Vol. VI. p. 322.]

³ [For the foliage of Harding, see Vol. III. pp. 578-579, 591, 596 *seq.*; Vol. VI. pp. 100-101; and Vol. XV. pp. 112 *seq.*]

§ 19. But the form in a perfect tree is dependent on the revolution of this sectional profile, so as to produce a mushroom-shaped or cauliflower-shaped mass, of which I leave the reader to enjoy the perspective drawing by himself, adding, after he has completed it, the effect of the law of resilience to the extremities. Only, he must note this: that in real trees, as the branches rise from the ground, the open spaces underneath are partly filled by subsequent branchings, so that a real tree has not so much the shape of a mushroom, as of an apple, or, if elongated, a pear.

§ 20. And now you may just begin to understand a little of Turner's meaning in those odd pear-shaped trees of his,¹ in the "Mercury and Argus," and other such compositions: which, however, before we can do completely, we must gather our evidence together, and see what general results will come of it respecting the hearts and fancies of trees, no less than their forms.

¹ [See Vol. VI. p. 300. For "Mercury and Argus," see Plate 14 in Vol. III. (p. 638).]

CHAPTER VIII

THE LEAF MONUMENTS

§ 1. AND now, having ascertained in its main points the system on which the leaf-workers build, let us see, finally, what results in aspect, and appeal to human mind, their building must present. In some sort it resembles that of the coral animal, differing, however, in two main points. First, the animal which forms branched coral, builds, I believe, in calm water, and has few accidents of current, light, or heat to contend with. He builds in monotonous ramification, untormented, therefore unbeautiful. Secondly, each coral animal builds for himself, adding his cell to what has been before constructed, as a bee adds another cell to the comb. He obtains no essential connection with the root and foundation of the whole structure. That foundation is thickened clumsily, by a fused and encumbering aggregation, as a stalactite increases;—not by threads proceeding from the extremities to the root.

§ 2. The leaf, as we have seen, builds in both respects under opposite conditions. It leads a life of endurance, effort, and various success, issuing in various beauty; and it connects itself with the whole previous edifice by one sustaining thread, continuing its appointed piece of work all the way from top to root. Whence result three great conditions in branch aspect, for which I cannot find good names, but must use the imperfect ones of “Spring,” “Caprice,” “Fellowship.”

§ 3. I. SPRING: or the appearance of elastic and progressive power, as opposed to the look of a bent piece of cord.—This follows partly on the poise of the bough,

partly on its action in seeking or shunning. Every branch-line expresses both these. It takes a curve accurately showing the relations between the strength of the sprays in that position (growing downward, upward, or laterally), and the weight of leaves they carry; and again, it takes a curve expressive of the will or aim of those sprays, during all their life, and handed down from sire to son, in steady inheritance of resolution to reach forward in a given direction, or bend away from some given evil influence.

And all these proportionate strengths and measured efforts of the bough produce its loveliness, and ought to be felt, in looking at it, not by any mathematical evidence, but by the same fine instinct which enables us to perceive, when a girl dances rightly, that she moves easily, and with delight to herself; that her limbs are strong enough, and her body tender enough, to move precisely as she wills them to move. You cannot say of any bend of arm or foot what precise relations of their curves to the whole figure manifest, in their changeful melodies, that ease of motion; yet you feel that they do so, and you feel it by a true instinct. And if you reason on the matter farther, you may know, though you cannot see, that an absolute mathematical necessity proportions every bend of the body to the rate and direction of its motion, and that the momentary fancy and fire of the will measure themselves, even in their gaily-fancied freedom, by stern laws of nervous life, and material attraction, which regulate eternally every pulse of the strength of man, and every sweep of the stars of heaven.

§ 4. Observe, also, the balance of the bough of a tree is quite as subtle as that of a figure in motion. It is a balance between the elasticity of the bough and the weight of leaves, affected in curvature, literally, by the growth of *every* leaf; and besides this, when it moves, it is partly supported by the resistance of the air, greater or less, according to the shape of leaf;—so that branches float on the wind more than they yield to it; and in their tossing

do not so much bend under a force, as rise on a wave, which penetrates in liquid threads through all their sprays.

§ 5. I am not sure how far, by any illustration, I can exemplify these subtle conditions of form. All my plans have been shortened, and I have learned to content myself with yet more contracted issues of them after the shortening, because I know that nearly all in such matters must be said or shown, unavailably. No saying will teach the truth. Nothing but doing. If the reader will draw boughs of trees long and faithfully, giving previous pains to gain the power (how rare!) of drawing *anything* faithfully, he will come to see what Turner's work is, or any other right work, but not by reading, nor thinking, nor idly looking. However, in some degree, even our ordinary instinctive perception of grace and balance may serve us, if we choose to pay any accurate attention to the matter.

§ 6. Look back to Fig. 55. That bough of Turner's is exactly and exquisitely poised, leaves and all, for its present horizontal position. Turn the book so as to put the spray upright, with the leaves at the top. You ought to see they would then be wrong;—that they must, in that position, have adjusted themselves more directly above the main stem, and more firmly, the curves of the lighter sprays being a deflection caused by their weight in the horizontal position. Again, Fig. 56 represents, enlarged to four times the size of the original, the two Scotch firs in Turner's etching of Inverary.* These are both in perfect poise, representing a double action: the warping of the trees away from the sea-wind, and the continual growing out of the boughs on the right-hand side, to recover the balance.

* They are enlarged, partly, in order to show the care and minuteness of Turner's drawing on the smallest scale, partly to save the reader the trouble of using a magnifying glass, partly because this woodcut will print safely; while if I had facsimiled the fine Turner etching,¹ the block might have been spoiled after a hundred impressions.

¹ [In *Liber Studiorum*; the drawing for the Plate is No. 501 in the National Gallery.]

Turn the page so as to be horizontal, and you ought to feel that, considered now as branches, both would be out of balance. If you turn the heads of the trees to your right,

*Fig. 57**Fig. 58*

they are wrong, because gravity would have bent them more downwards; if to your left, wrong, because the law of resilience would have raised them more at the extremities.

§ 7. Now take two branches of Salvator's, Figs. 57 and

56-57

56-57

58.* You ought to feel that these have neither poise nor spring; their leaves are incoherent, ragged, hanging together in decay.

Immediately after these, turn to Plate 57 opposite. The branch at the top is facsimiled from that in the hand of Adam, in Dürer's Adam and Eve.† It is full of the most exquisite vitality and spring in every line. Look at it for five minutes carefully. Then turn back to Salvator's, Fig. 57. Are you as well satisfied with it? You ought to feel that it is not strong enough at the origin to sustain the leaves; and that if it were, those leaves themselves are in broken or forced relations with each other. Such relations might, indeed, exist in a partially withered tree, and one of these branches is intended to be partially withered, but the other is not; and if it were, Salvator's choice of the withered tree is precisely the sign of his preferring ugliness to beauty, decrepitude and disorganization to life and youth. The leaves on the spray, by Dürer, hold themselves as the girl holds herself in dancing; those on Salvator's, as an old man, partially palsied, totters along with broken motion, and loose deflection of limb.

§ 8. Next, let us take a spray by Paul Veronese‡—the

* Magnified to twice the size of the original, but otherwise facsimiled from his own etchings of Oedipus, and the School of Plato.

† The parrot perched on it is removed, which may be done without altering the curve, as the bird is set where its weight would not have bent the wood.¹

‡ The largest laurel spray in the background of the "Susanna," Louvre²—reduced to about a fifth of the original. The drawing was made for me by M. Hippolyte Dubois,³ and I am glad it is not one of my own, lest I should be charged with exaggerating Veronese's accuracy.

This group of leaves is, in the original, of the life-size; the circle which interferes with the spray on the right being the outline of the head of one of the elders; and, as painted for distant effect, there is no care in completing the stems:—they are struck with a few broken touches of the brush, which cannot be imitated in the engraving, and much of their spirit is lost in consequence.

¹ [For other references to the "Adam and Eve," see Vol. V. p. 159 and *n.*]

² [For another reference to the "exquisitely painted laurel leaves" in this picture, see "Notes on the Louvre" (Vol. XII. p. 460). The original Plate has been slightly reduced for this edition.]

³ [Henri Pierre Hippolyte Dubois, French engraver, 1837-1890.]

lower figure in Plate 57. It is just as if we had gathered one out of the garden. Though every line and leaf in the quadruple group is necessary to join with other parts of the composition of the noble picture, every line and leaf is also as free and true as if it were growing. None are confused, yet none are loose; all are individual, yet none separate, in tender poise of pliant strength and fair order of accomplished grace, each, by due force of the indulgent bough, set and sustained.¹

§ 9. Observe, however, that in all these instances from earlier masters, the expression of the universal botanical law of poise is independent of accuracy in rendering of species. As before noticed,² the neglect of specific distinction long restrained the advance of landscape, and even hindered Turner himself in many respects. The sprays of Veronese are a conventional type of laurel; Albert Dürer's, an imaginary branch of paradisiacal vegetation; Salvator's, a rude reminiscence of sweet chestnut; Turner's only is a faithful rendering of the Scotch fir.

Fig. 59

§ 10. To show how the principle of balance is carried out by Nature herself, here is a little terminal upright spray of willow, the most graceful of English trees (Fig. 59). I have drawn it carefully; and if the reader will study its curves, or, better, trace and pencil them with a perfectly fine point, he will feel, I think, without difficulty, their finished relation to the leaves they sustain. Then, if

¹ [The MS. adds here :—]

“That Paul Veronese is botanically right in every line is the natural result of the tender thought which makes him seek the loveliness of every line. Salvator's preference for distortion makes his very distortion false. Veronese's delight in what is perfect and fair makes all his fairness true.”

² [See, on the subject of generalisation, the Preface to the second edition of *Modern Painters*, vol. i. §§ 27 *seq.* (Vol. III. pp. 33 *seq.*, and compare *ibid.*, pp. 333, 435, and Vol. IV. pp. 173–174).]

we turn suddenly to a piece of Dutch branch-drawing (Fig. 60), facsimiled from No. 160 Dulwich Gallery (Berghem),¹ he will understand, I believe, also the qualities of that, without comment of mine. It is of course not so dark in

Fig. 60

the original, being drawn with the chance dashes of a brush loaded with brown, but the contours are absolutely as in the woodcut. This Dutch design is a very characteristic example of two faults in tree-drawing; namely, the loss not only of grace and spring, but of woodiness. A branch is

¹ [Now No. 122: "A Road through a Wood, with Figures."]

not elastic as steel is, neither as a carter's whip is. It is a combination, wholly peculiar, of elasticity with half-dead and sapless stubbornness, and of continuous curve with pauses of knottiness, every bough having its blunted, affronted, fatigued, or repentant moments of existence, and mingling crabbed rugosities and fretful changes of mind with the main tendencies of its growth. The piece of pollard willow (Fig. 61), facsimiled from Turner's etching of "Young Anglers," in the *Liber Studiorum*,¹ has all these characters in perfectness, and may serve for sufficient study of them. It is impossible to explain in what the expression of the woody strength consists, unless it be felt. One very obvious condition is the excessive fineness of curvature, approximating continually to a straight line. In order to get a piece of branch curvature given as accurately as I could by an unprejudiced person, I set one of my pupils at the Working Men's College (a joiner by trade)² to draw, last spring, a lilac branch of its real size, as it grew, before it budded. It was about six feet long, and before he could get it quite right, the buds came out and interrupted him; but the fragment he got drawn is engraved in flat profile, in Plate 58. It has suffered much by reduction, one or two of its finest curves having become lost in the mere thickness of the lines. Nevertheless, if the reader will compare it carefully with the Dutch work, it will teach him something about trees.

§ 11. II. CAPRICE.—The next character we had to note of the leaf-builders was their capriciousness, noted partly in Vol. III. Chap. IX. § 14.³ It is a character connected with the ruggedness and ill-temperedness just spoken of, and an essential source of branch beauty: being in reality the written story of all the branch's life,—of the theories it formed, the accidents it suffered, the fits of enthusiasm to which it yielded in certain delicious warm springs; the

¹ [The drawing for the Plate is No. 510 in the National Gallery.]

58 Branch Curvature

Fig. 61

disgusts at weeks of east wind, the mortifications of itself for its friends' sakes; or the sudden and successful inventions of new ways of getting out to the sun. The reader will understand this character in a moment, by merely comparing Fig. 62, which is a branch of Salvator's,* with Fig. 63, which I have traced from the engraving, in the Yorkshire series, of Turner's "Aske Hall."¹ You cannot but feel at once, not

only the wrongness of Salvator's, but its dulness. It is not now a question either of poise, or grace, or gravity; only of wit. That bough has got no sense; it has not been struck by a single new idea from the beginning of it to the end; dares not even cross itself with one of its own sprays. You will be amazed, in taking up any of these old engravings, to see how seldom the boughs *do* cross each other Whereas,

* The longest in "Apollo and the Sibyl," engraved by Boydell. (Reduced one-half.)

¹ [For another reference to the "Aske Hall," see Vol. III. p. 586.]

in nature, not only is the intersection of extremities a mathematical necessity (see Plate 56), but out of this intersection and crossing of curve by curve, and the opposition of line it involves, the best part of their composition arises. Look at the way the boughs are interwoven in that piece of lilac stem (Plate 58).

§ 12. Again: As it seldom struck the old painters that boughs must cross each other, so it never seems to have occurred to them that they must be sometimes foreshortened. I chose this bit from "Aske Hall," that you might see at once, both how Turner foreshortens the main stem, and how, in doing so, he shows the turning aside, and outwards, of the one next to it, to the left, to get more air.* Indeed, this foreshortening lies at the core of the business; for unless it be well understood, no branch-form can ever be rightly drawn. I placed the oak spray in Plate 51, so as to be seen as nearly straight on its flank as possible. It is the most uninteresting position in which a bough can be drawn; but it shows the first simple action of the law of resilience. I will now turn the bough with its extremity towards us, and foreshorten it (Plate 59), which being done, you perceive another tendency in the whole branch, not seen at all in the first Plate, to throw its sprays to its own right (or to your left), which it does to avoid the branch next it, while the *forward* action is in a sweeping curve round to your right, or to the branch's left: a curve which it takes to recover position after its first concession. The lines of the nearer and smaller shoots are very nearly—thus foreshortened—those of a boat's bow. Here is a piece of Dutch foreshortening for you to compare with it, Fig. 64.†

* The foreshortening of the bough to the right is a piece of great audacity; it comes towards us two or three feet sharply, after forking, so as to look suddenly half as thick again as at the fork; then bends back again, and outwards.

† Hobbima. Dulwich Gallery, No. 131.¹ Turn the book with its outer edge down.

¹ [Now No. 87. See above, Part vi. ch. v. § 5.]

P. 1247.

59. The Dryad's Waywardness.

§ 13. In this final perfection of bough-drawing, Turner stands *wholly alone*. Even Titian does not foreshorten his boughs rightly. Of course he could, if he had cared to do so; for if you can foreshorten a limb or a hand, much more a tree branch. But either he had never looked at a tree carefully enough to feel that it was necessary, or, which is more likely, he disliked to introduce in a background elements of vigorous projection. Be the reason what it may, if you take Lefèvre's plates¹ of the Peter Martyr and St. Jerome—the only ones I know which give any idea of Titian's tree-drawing, you will observe at once that the boughs lie in flakes, artificially set to the right and left, and are not intricate or varied, even where the foliage indicates some foreshortening;—completing thus the evidence for my statement long ago given, that no man but Turner had ever drawn the stem of a tree.²

Fig. 64

§ 14. It may be well also to note, for the advantage of the general student of design, that, in foliage and bough drawing, all the final grace and general utility of the study

¹ [For particulars of these Plates, see below, Part viii. ch. ii. § 12. The "St. Jerome" (the second plate in Lefèvre's collection) is in the Church of S. Maria Nova in Venice; the "Peter Martyr" (for which see Vol. III. p. 28 n.) is the third Plate.]

² [See *Modern Painters*, vol. i. (Vol. III. p. 252), and compare *ibid.*, p. 585.]

depend on its being well foreshortened; and that, till the power of doing so quite accurately is obtained, no landscape-drawing is of the least value; nor can the character of any tree be known at all until not only its branches, but its minutest extremities, have been drawn in the severest foreshortening, with little accompanying plans of the arrangements of the leaves or buds, or thorns, on the stem. Thus Fig. 65 is the extremity of a single shoot of spruce fir, foreshortened, showing the resilience of its swords from beneath; and Fig. 66 is a little ground-plan, showing the position of the three lowest triple groups of thorn on a

Fig. 65

Fig. 66

shoot of gooseberry.* The fir shoot is carelessly drawn; but it is not worth while to do it better, unless I engraved it on steel, so as to show the fine relations of shade.

§ 15. III. FELLOWSHIP.—The compactness of mass presented by this little sheaf of pine-swords may lead us to the consideration of the last character I have to note of boughs; namely, the mode of their association in masses. It follows, of course, from all the laws of growth we have ascertained, that the terminal outline of any tree or branch must be a simple one, containing within it, at a given height or level, the series of leaves of the year; only we

* Their change from groups of three to groups of two, and then to single thorns at the end of the spray, will be found very beautiful in a real shoot. The figure on the left in Plate 52 [p. 40] is a branch of black-thorn with its spines (which are a peculiar condition of branch, and can bud like branches, while thorns have no root nor power of development). Such a branch gives good practice without too much difficulty.

have not yet noticed the kind of form which results, in each branch, from the part it has to take in forming the mass of the tree. The systems of branching are indeed infinite, and could not be exemplified by any number of types; but here are two common types, in section, which will enough explain what I mean.

§ 16. If a tree branches with a concave tendency, it is apt to carry its boughs to the outer curve of limitation, as

Fig. 67

at A, Fig. 67, and if with a convex tendency, as at B. In either case the vertical section, or profile, of a bough will give a triangular mass, terminated by curves, and elongated at one extremity. These triangular masses you may see at a glance, prevailing in the branch system of any tree in winter. They may, of course, be mathematically reduced to the four types, *a*, *b*, *c*, and *d*, Fig. 67, but are capable of endless variety of expression in action, and in the adjustment of their weights to the bearing stem.

§ 17. To conclude, then, we find that the beauty of these buildings of the leaves consists, from the first step of

it to the last, in its showing their perfect fellowship; and a single aim uniting them under circumstances of various distress, trial, and pleasure. Without the fellowship, no beauty; without the steady purpose, no beauty; without trouble, and death, no beauty; without individual pleasure, freedom, and caprice, so far as may be consistent with the universal good, no beauty.

Fig. 68

§ 18. Tree-loveliness might be thus lost or killed in many ways. Discordance would kill it—of one leaf with another; disobedience would kill it—of any leaf to the ruling law; indulgence would kill it, and the doing away with pain; or slavish symmetry would kill it, and the doing away with delight. And this is so, down to the smallest atom and beginning of life: so soon as there is life at all, there are these four conditions of it;—harmony, obedience, distress, and delightful inequality. Here is the magnified section of an oak-bud, not the size of a wheat grain (Fig. 68). Already its nascent leaves are seen arranged under the perfect law of resilience, preparing for stoutest work on the right side. Here is a dogwood bud just opening into life (Fig. 69). Its ruling law is to be four square, but see how the uppermost leaf takes the lead, and the lower bends up, already a little distressed by the effort. Here is a birch-bud, farther advanced (Fig. 70). Who shall say how many humours the little thing has in its mind already; or how many adventures it has passed through? And so to the end. Help, submission, sorrow, dissimilarity, are the sources of all good;—war, disobedience, luxury, equality, the sources of all evil.

Fig. 69

§ 19. There is yet another and a deeply laid lesson to be received from the leaf-builders, which I hope the reader has already perceived. Every leaf, we have seen, connects its work with the entire and accumulated result of the work of its predecessors. Their previous construction served it during its life, raised it towards the light, gave it more free sway and motion in the wind, and removed it from the

*Fig. 70*

noxiousness of earth exhalation. Dying, it leaves its own small but well-laboured thread, adding, though imperceptibly, yet essentially, to the strength, from roof to crest, of the trunk on which it had lived, and fitting that trunk for better service to succeeding races of leaves.

We men, sometimes, in what we presume to be humility, compare ourselves with leaves; but we have as yet no right to do so. The leaves may well scorn the comparison. We, who live for ourselves, and neither know how to

use nor keep the work of past time, may humbly learn,—as from the ant, foresight,—from the leaf, reverence. The power of every great people, as of every living tree, depends on its not effacing, but confirming and concluding, the labours of its ancestors. Looking back to the history of nations, we may date the beginning of their decline from the moment when they ceased to be reverent in heart, and accumulative in hand and brain; from the moment when the redundant fruit of age hid in them the hollowness of heart, whence the simplicities of custom and sinews of tradition had withered away. Had men but guarded the righteous laws, and protected the precious works of their fathers, with half the industry they have given to change and to ravage, they would not now have been seeking vainly, in millennial visions and mechanic servitudes, the accomplishment of the promise made to them so long ago: “As the days of a tree are the days of My people, and Mine elect shall long enjoy the work of their hands; they shall not labour in vain, nor bring forth for trouble; for they are the seed of the blessed of the Lord, and their offspring with them.”¹

§ 20. This lesson we have to take from the leaf's life. One more we may receive from its death. If ever, in autumn, a pensiveness falls upon us as the leaves drift by in their fading, may we not wisely look up in hope to their mighty monuments? Behold how fair, how far prolonged, in arch and aisle, the avenues of the valleys; the fringes of the hills! So stately,—so eternal; the joy of man, the comfort of all living creatures, the glory of the earth,—they are but the monuments of those poor leaves that flit faintly past us to die. Let them not pass, without our understanding their last counsel and example: that we also, careless of monument by the grave, may build it in the world—monument by which men may be taught to remember, not where we died, but where we lived.

¹ [Isaiah lxxv. 23.]

CHAPTER IX

THE LEAF SHADOWS

§ 1. IT may be judged, by the time which it has taken to arrive at any clear idea of the structure of shield-builders, what a task would open to us if we endeavoured to trace the more wonderful forms of the wild builders with the sword.¹ Not that they are more complex; but they are more definite, and cannot be so easily generalized. The conditions which produce the spire of the cypress, and flaked breadth of the cedar, the rounded head of the stone pine, and perfect pyramid of the black spruce, are far more distinct, and would require more accurate and curious diagrams to illustrate them, than the graceful, but in some degree monotonous, branching of shield-builders. In broad principle they are, however, alike. The leaves construct the sprays in the same accumulative way: the only essential difference being that in the sword-builders the leaves are all set close, and at equal intervals. Instead of admitting extended and variable spaces between them, the whole spray is one tower of leaf-roots, set in a perfect spiral. Thus, Fig. 71, at A, represents a fragment of spray of Scotch fir of its real size. B is the same piece magnified, the diamond-like spaces being the points on which the leaves grew. The dotted lines show the regularity of the spiral. As the minor stems join in boughs, the scars left by the leaves are gradually effaced, and a thick, but broken and scaly bark forms instead.²

¹ [See above, p. 23.]

² [With Fig. 71 compare the drawing (Figs. 7-10) in the lecture on "Tree Twigs"; below, p. 471.]

§ 2. A sword-builder may therefore be generally considered as a shield-builder put under the severest military restraint. The graceful and thin leaf is concentrated into a strong, narrow, pointed rod; and the insertion of these

rods on the stem is in a close and perfectly timed order. In some ambiguous trees connected with the tribe (as the *arbor vitæ*¹) there is no proper stem to the outer leaves, but all the extremities form a kind of coralline leaf, flat and fern-like, but articulated like a crustacean animal, which gradually concentrates and embrowns itself into the stem. The thicker branches

Fig. 71

of these trees are exquisitely fantastic; and the mode in which the flat system of leaf first produces an irregular branch, and then adapts itself to the symmetrical cone of the whole tree, is one of the most interesting processes of form which I know in vegetation.

§ 3. Neither this, however, nor any other of the pine formations, have we space here to examine in detail; while without detail, all discussion of them is in vain. I shall only permit myself to note a few points respecting my favourite tree,² the black spruce, not with any view to art criticism (though we might get at some curious results by a comparison of popular pine-drawing in Germany, America, and other dark-wooded countries, with the true natural forms), but because I think the expression of this tree has

¹ [For this tree, see the illustration in Ruskin's lecture on "Tree Twigs"; below, Appendix I., p. 472.]

² [Compare *Seven Lamps* (Vol. VIII. p. 124), and *Stones of Venice*, vol. i. (Vol. IX. p. 187).]

not been rightly understood by travellers in Switzerland, and that with a little watching of it, they might easily obtain a juster feeling.

§ 4. Of the many marked adaptations of nature to the mind of man, it seems one of the most singular, that trees intended especially for the adornment of the wildest mountains should be in broad outline the most formal of trees. The vine, which is to be the companion of man, is waywardly docile in its growth, falling into festoons beside his cornfields, or roofing his garden-walks, or casting its shadow all summer upon his door. Associated always with the trimness of cultivation, it introduces all possible elements of sweet wildness. The pine, placed nearly always among scenes disordered and desolate, brings into them all possible elements of order and precision. Lowland trees may lean to this side and that, though it is but a meadow breeze that bends them, or a bank of cowslips from which their trunks lean aslope. But let storm and avalanche do their worst, and let the pine find only a ledge of vertical precipice to cling to, it will nevertheless grow straight. Thrust a rod from its last shoot down the stem; it shall point to the centre of the earth as long as the tree lives.

§ 5. Also it may be well for lowland branches to reach hither and thither for what they need, and to take all kinds of irregular shape and extension. But the pine is trained to need nothing, and to endure everything. It is resolutely whole, self-contained, desiring nothing but rightness, content with restricted completion. Tall or short, it will be straight. Small or large, it will be round. It may be permitted also to these soft lowland trees that they should make themselves gay with show of blossom, and glad with pretty charities of fruitfulness. We builders with the sword have harder work to do for man, and must do it in close-set troops. To stay the sliding of the mountain snows, which would bury him; to hold in divided drops, at our sword-points, the rain which would sweep away him and his

treasure-fields; to nurse in shade among our brown fallen leaves the tricklings that feed the brooks in drought; to give massive shield against the winter wind, which shrieks through the bare branches of the plain:—such service must we do him stedfastly while we live. Our bodies, also, are at his service: softer than the bodies of other trees, though our toil is harder than theirs. Let him take them as pleases him, for his houses and ships. So also it may be well for these timid lowland trees to tremble with all their leaves, or turn their paleness to the sky, if but a rush of rain passes by them; or to let fall their leaves at last, sick and sere. But we pines must live carelessly amidst the wrath of clouds. We only wave our branches to and fro when the storm pleads with us, as men toss their arms in a dream.

And finally, these weak lowland trees may struggle fondly for the last remnants of life, and send up feeble saplings again from their roots when they are cut down. But we builders with the sword perish boldly; our dying shall be perfect and solemn, as our warring: we give up our lives without reluctance, and for ever.*

§ 6. I wish the reader to fix his attention for a moment on these two great characters of the pine, its straightness and rounded perfectness; both wonderful, and in their issue lovely, though they have hitherto prevented the tree from being drawn. I say, first, its straightness. Because we constantly see it in the wildest scenery, we are apt to remember only as characteristic examples of it those which have been disturbed by violent accident or disease. Of course such instances are frequent. The soil of the pine is subject to continual change; perhaps the rock in which it is rooted splits in frost and falls forward, throwing the young stems aslope, or the whole mass of earth round it is undermined by rain, or a huge boulder falls on its stem from above,

* "Cræsus, therefore, having heard these things, sent word to the people of Lampsacus that they should let Miltiades go; and, if not, he would cut them down like a pine-tree."—*Herod.* vi. 37.

and forces it for twenty years to grow with weight of a couple of tons leaning on its side. Hence, especially at edges of loose cliffs, about waterfalls, or at glacier banks, and in other places liable to disturbance, the pine may be seen distorted and oblique; and in Turner's "Source of the Arveron,"¹ he has, with his usual unerring perception of the main point in any matter, fastened on this means of relating the glacier's history. The glacier cannot explain its own motion; and ordinary observers saw in it only its rigidity; but Turner saw that the wonderful thing was its non-rigidity. Other ice is fixed, only this ice stirs. All the banks are staggering beneath its waves, crumbling and withered as by the blast of a perpetual storm. He made the rocks of his foreground loose—rolling and tottering down together; the pines smitten aside by them, their tops dead, bared by the ice wind.

§ 7. Nevertheless, this is not the truest or universal expression of the pine's character. I said long ago, even of Turner: "Into the spirit of the pine he cannot enter."² He understood the glacier at once; he had seen the force of sea on shore too often to miss the action of those crystal-crested waves. But the pine was strange to him, adverse to his delight in broad and flowing line; he refused its magnificent erectness. Magnificent!—nay, sometimes almost terrible. Other trees, tufting crag or hill, yield to the form and sway of the ground, clothe it with soft compliance, are partly its subjects, partly its flatterers, partly its comforters. But the pine rises in serene resistance, self-contained; nor can I ever without awe stay long under a great Alpine cliff, far from all house or work of men, looking up to its companies of pines, as they stand on the inaccessible juts and perilous ledges of the enormous wall, in

¹ [In the *Liber Studiorum*; the drawing for the Plate is No. 379 in the National Gallery. For another reference to the Plate, see Vol. VI. p. 373. For drawings of pines by Turner and by Ruskin respectively, see Plates 3 and 4 in Vol. III. (pp. 238, 240).]

² [See *Modern Painters*, vol. i. (Vol. III. p. 236), and compare Vol. VI. p. 170 *n.*, and Vol. XIII. p. 513.]

quiet multitudes, each like the shadow of the one beside it—upright, fixed, spectral, as troops of ghosts standing on the walls of Hades, not knowing each other—dumb for ever. You cannot reach them, cannot cry to them;—those trees never heard human voice; they are far above all sound but of the winds. No foot ever stirred fallen leaf of theirs. All comfortless they stand, between the two eternities of the Vacancy and the Rock: yet with such iron will, that the rock itself looks bent and shattered beside them—fragile, weak, inconsistent, compared to their dark energy of delicate life, and monotony of enchanted pride:—unnumbered, unconquerable.

§ 8. Then note, farther, their perfectness. The impression on most people's minds must have been received more from pictures than reality, so far as I can judge:—so ragged they think the pine; whereas its chief character in health is green and full *roundness*. It stands compact, like one of its own cones, slightly curved on its sides, finished and quaint as a carved tree in some Elizabethan garden; and instead of being wild in expression, forms the softest of all forest scenery; for other trees show their trunks and twisting boughs: but the pine, growing either in luxuriant mass or in happy isolation, allows no branch to be seen. Summit behind summit rise its pyramidal ranges, or down to the very grass sweep the circlets of its boughs; so that there is nothing but green cone and green carpet. Nor is it only softer, but in one sense more cheerful than other foliage; for it casts only a pyramidal shadow. Lowland forest arches overhead, and chequers the ground with darkness; but the pine, growing in scattered groups, leaves the glades between emerald-bright. Its gloom is all its own; narrowing into the sky, it lets the sunshine strike down to the dew. And if ever a superstitious feeling comes over me among the pine-glades, it is never tainted with the old German forest fear; but is only a more solemn tone of the fairy enchantment that haunts our English meadows; so that I have always called the prettiest pine-glade in Chamouni, "Fairies'

Hollow." It is in the glen beneath the steep ascent above Pont Pelissier, and may be reached by a little winding path which goes down from the top of the hill;¹ being, indeed, not truly a glen, but a broad ledge of moss and turf, leaning in a formidable precipice (which, however, the gentle branches hide) over the Arve. An almost isolated rock promontory, many-coloured, rises at the end of it. On the other sides it is bordered by cliffs, from which a little cascade falls, literally, down among the pines, for it is so light, shaking itself into mere showers of seed pearl in the sun, that the pines don't know it from mist, and grow through it without minding. Underneath, there is only the mossy silence, and above, for ever, the snow of the Nameless Aiguille.

§ 9. And then the third character which I want you to notice in the pine is its exquisite fineness. Other trees rise against the sky in dots and knots, but this in fringes.* You

* Keats, (as is his way) puts nearly all that may be said of the pine into one verse, though they are only figurative pines of which he is speaking. I have come to that pass of admiration for him now, that I dare not read him, so discontented he makes me with my own work:² but others must not leave

¹ [The passage, beginning in the eighth line of § 7—"Magnificent!"—and ending at the end of § 10, is § 47 in *Frondees Ayrestes*, where, however, the author's footnote to § 9 and the words "And then the third character . . . fineness" are omitted. At this point Ruskin added the following note in *Frondees*:—

"The new road to Chamouni has been carried right through it. A cascade on the right, as you ascend, marks the place spoken of in the text, —once as lovely as Corrie-nan-shian."

(The name Corrie-nan-shian—Gaelic for "Glen of the Fairies"—is given to many spots in the Highlands (see, e.g., Scott's *Monastery*, ch. viii.). The old rough char-road from St. Martin to Chamouni kept to the right bank of the Arve (compare Vol. II. p. 425 n.), which it crossed at Pont Pelissier, thence reaching Chamouni by a steep and rough ascent called Les Montets or Montées. The new road keeps to the left bank of the river, the old road falling into it at the Hôtel des Montets. About a mile and a half before this stands the Restaurant du Châtelard, in the grassy glade which was once "Fairies' Hollow." The Electric Railway (opened in 1901) passes the spot in a tunnel. The Aiguille Sans Nem (seen in the distance) is the western buttress of the Aiguille Verte. In a MS. plan for vol. iii. of *Præterita* it appears that the tenth chapter was to be called "Fairies' Hollow at Chamouni," and to treat of "my last happy days there with old Couttet.")

² [Whereas Ruskin's feeling for Shelley's poetry fluctuated (see Vol. I. p. 253 n.), his admiration for Keats was constant. He placed Keats, indeed, in his second class of poets—among those, that is, who are subject to "the pathetic fallacy" (Vol. I. p. 210); and he notices the morbid strain in Keats (see, e.g. Vol. V. pp. 338, 343). But

never see the edges of it, so subtle are they; and for this reason, it, chiefly of trees,¹ is capable of the fiery change which we saw before had been noticed by Shakespere.² When the sun rises behind a ridge crested with pine, provided the ridge be at a distance of about two miles, and

unread, in considering the influence of trees upon the human soul, that marvellous Ode to Psyche. Here is the piece about pines :—

“Yes, I will be thy priest, and build a fane
 In some untrodden region of my mind,
 Where branched thoughts, new grown with pleasant pain,
 Instead of pines, shall murmur in the wind :
 Far, far around shall those dark-clustered trees
Fledge the wild-ridged mountains, steep by steep ;
 And there by zephyrs, streams, and birds, and bees,
 The moss-lain Dryads shall be lull'd to sleep ;
 And in the midst of this wide quietness
 A rosy sanctuary will I dress
 With the wreath'd trellis of a working brain,
 With buds, and bells, and stars without a name,
 With all the gardener Fancy e'er could feign,
 Who, breeding flowers, will never breed the same ;
 And there shall be for thee all soft delight
 That shadowy thought can win ;
 A bright torch, and a casement ope at night,
 To let the warm Love in.”

it is a “gentle depth of sadness” (*Art of England*, § 176); the poet’s mind is compared to Turner’s (see below, pt. ix. ch. ix. § 9), and, like Turner, he suffered from want of appreciation (Vol. VI. p. 472, and below, pt. ix. ch. xii. § 14). His fancy is exquisite (Vol. IV. p. 293); his colouring, “rich even to excess” (Vol. V. p. 328); if his themes are sometimes horrible, they are executed with perfection of art (Vol. IV. p. 380); his descriptions have an “exquisite sincerity” (Vol. V. p. 208); his sense of beauty is comparable with Turner’s (below, part ix. ch. xi. § 26); his imagination enabled him to interpret accurately the religion of the Greeks (*Queen of the Air*, § 17). For Ruskin’s numerous quotations from Keats, see the General Index. In connexion with the present passage a reminiscence by Lady Burne-Jones, referring to a tour in Switzerland with Ruskin in 1862, may be cited: “I have a vision of us all three sitting together that evening (at Fluelen), in a room with an exquisitely clean bare-boarded floor, and Mr. Ruskin reading Keats to us” (*Memorials of Edward Burne-Jones*, vol. i. p. 243). In one of his last lectures at Oxford Ruskin told his pupils to “read as much Keats as possible” (Vol. I. p. 264 n.).]

¹ [Editions 1 and 1873 (and *Frondes Agrestes*) read here: “. . . it alone of trees, so far as I know, is capable . . .,” and seven lines lower:—

“. . . the sun itself. I thought at first this was owing to the actual lustre of the leaves; but I believe now it is caused by the cloud-dew upon them,—every minutest leaf carrying its diamond. It seems . . .”

The alterations in the text above were first introduced in the edition of 1888, from Ruskin’s revised copy.]

² [See Vol. VI. p. 452.]

seen clear, all the trees, for about three or four degrees on each side of the sun, become trees of light, seen in clear flame against the darker sky, and dazzling as the sun itself. This is owing to the lustre of the leaves, and their minute division. It seems as if these trees, living always among the clouds, had caught part of their glory from them; and themselves the darkest of vegetation, could yet add splendour to the sun itself.

§ 10. Yet I have been more struck by their character of finished delicacy at a distance from the central Alps, among the pastoral hills of the Emmenthal, or lowland districts of Berne, where they are set in groups between the cottages, whose shingle roofs (they also of pine) of deep gray blue, and lightly carved fronts, golden and orange in the autumn sunshine,* gleam on the banks and lawns of hill-side,—endless lawns, mounded, and studded, and bossed all over with deeper green hay-heaps, orderly set, like jewellery (the mountain hay, when the pastures are full of springs, being strangely dark and fresh in verdure for a whole day after it is cut). And amidst this delicate delight of cottage and field, the young pines stand delicatest of all, scented as with frankincense, their slender stems straight as arrows, and crystal white, looking as if they would break with a touch like needles; and their arabesques of dark leaf pierced through and through by the pale radiance of clear sky, opal blue, where they follow each other along the soft hill-ridges, up and down.

§ 11. I have watched them in such scenes with the deeper interest, because of all trees they have hitherto had most influence on human character. The effect of other vegetation, however great, has been divided by mingled species; elm and oak in England, poplar in France, birch in Scotland, olive in Italy and Spain, share their power

* There has been much cottage-building about the hills lately, with very pretty carving, the skill in which has been encouraged by travellers; and the fresh-cut larch is splendid in colour under rosy sunlight.

with inferior trees, and with all the changing charm of successive agriculture. But the tremendous unity of the pine absorbs and moulds the life of a race. The pine shadows rest upon a nation. The Northern peoples, century after century, lived under one or other of the two great powers of the Pine and the Sea, both infinite. They dwelt amidst the forests, as they wandered on the waves, and saw no end, nor any other horizon; still the dark green trees, or the dark green waters, jagged the dawn with their fringe or their foam. And whatever elements of imagination, or of warrior strength, or of domestic justice, were brought down by the Norwegian and the Goth against the dissoluteness or degradation of the South of Europe, were taught them under the green roofs and wild penetralia of the pine.

§ 12. I do not attempt, delightful as the task would be, to trace this influence (mixed with superstition) in Scandinavia, or North Germany; but let us at least note it in the instance which we speak of so frequently, yet so seldom take to heart. There has been much dispute respecting the character of the Swiss, arising out of the difficulty which other nations had to understand their simplicity. They were assumed to be either romantically virtuous, or basely mercenary, when in fact they were neither heroic nor base, but were true-hearted men, stubborn with more than any recorded stubbornness; not much regarding their lives, yet not casting them causelessly away; forming no high ideal of improvement, but never relaxing their grasp of a good they had once gained; devoid of all romantic sentiment, yet loving with a practical and patient love that neither wearied nor forsook; little given to enthusiasm in religion, but maintaining their faith in a purity which no worldliness deadened, and no hypocrisy soiled; neither chivalrously generous nor pathetically humane, yet never pursuing their defeated enemies, not suffering their poor to perish; proud, yet not allowing their pride to prick them into unwary or unworthy quarrel; avaricious, yet contentedly rendering to their neighbour his due; dull, but clear-sighted to all

the principles of justice; and patient, without ever allowing delay to be prolonged by sloth, or forbearance by fear.

§ 13. This temper of Swiss mind, while it animated the whole confederacy, was rooted chiefly in one small district which formed the heart of their country, yet lay not among its highest mountains. Beneath the glaciers of Zermatt and Evolena, and on the scorching slopes of the Valais, the peasants remained in an aimless torpor, unheard of but as the obedient vassals of the great Bishopric of Sion. But where the lower ledges of calcareous rock were broken by the inlets of the Lake Lucerne, and bracing winds penetrating from the north forbade the growth of the vine, compelling the peasantry to adopt an entirely pastoral life, was reared another race of men. Their narrow domain should be marked by a small green spot on every map of Europe. It is about forty miles from east to west; as many from north to south; yet on that shred of rugged ground, while every kingdom of the world around it rose or fell in fatal change, and every multitudinous race mingled or wasted itself in various dispersion and decline, the simple shepherd dynasty remained changeless. There is no record of their origin. They are neither Goths, Burgundians, Romans, nor Germans. They have been for ever Helvetii, and for ever free. Voluntarily placing themselves under the protection of the House of Hapsburg, they acknowledged its supremacy, but resisted its oppression; and rose against the unjust governors it appointed over them, not to gain, but to redeem, their liberties. Victorious in the struggle by the Lake of Egeri,¹ they stood the foremost standard-bearers among the nations of Europe in the cause of loyalty and life—loyalty in its highest sense, to the laws of God's helpful justice, and of man's faithful and brotherly fortitude.

§ 14. You will find among them, as I said, no subtle

¹ [On the shore of this lake, not far from Zug, was the battlefield of Morgarten, where on November 16, 1315, the Confederates won their first victory over the Hapsburgs; Ruskin visited the spot in 1858: see above, Introduction, p. xxxii. For other references to the battle, see Vol. V. p. 415; Vol. XVI. p. 190; *Eagle's Nest*, § 199; and *Præterita*, i. § 131.]

wit nor high enthusiasm, only an undeceivable common sense, and an obstinate rectitude. They cannot be persuaded into their duties, but they feel them; they use no phrases of friendship, but do not fail you at your need. Questions of creed, which other nations sought to solve by logic or reverie, these shepherds brought to practical tests; sustained with tranquillity the excommunication of abbots who wanted to feed their cattle on other people's fields, and, halbert in hand, struck down the Swiss Reformation, because the Evangelicals of Zurich refused to send them their due supplies of salt.¹ Not readily yielding to the demands of superstition, they were patient under those of economy; they would purchase the remission of taxes, but not of sins; and while the sale of indulgences was arrested in the church of Einsiedeln as boldly as at the gates of Wittenberg, the inhabitants of the valley of Frutigen* ate no meat for seven years, in order peacefully to free themselves and their descendants from the seigniorial claims of the Baron of Thurn.

§ 15. What praise may be justly due to this modest and rational virtue, we have perhaps no sufficient grounds for defining. It must long remain questionable how far the vices of superior civilization may be atoned for by its

* This valley is on the pass of the Gemmi in Canton Berne, but the people are the same in temper as those of the Waldstätten.

¹ ["In 1531, Zurich, in order to force the Catholic cantons to submit to its dictation, forbade all commerce with them, and even prevented the supply of necessary articles of provisions, such as salt, which the people of the Waldstätten used to receive through Zurich. . . . 'The sword alone can unloose the knot,' was the cry in the Waldstätten" (Vieusseux: *History of Switzerland*, 1840, p. 143). Ruskin refers again to this incident in *Time and Tide*, § 45. See the same *History*, p. 125, for the account of Zwingli's repulse of Friar Samson, who had come to sell indulgences at Einsiedeln in 1518. "The fine and extensive valley of Frütigen was sold to Bern by the Baron of Thurn, whose mismanagement had involved him in difficulties. When the inhabitants of Frütigen heard of the negotiation for the sale, they all agreed to strain every nerve in order to redeem the seigniorial fines and dues which had been transferred to their new masters. Every one contributed for this purpose his little savings, and it is stated in an old song that the whole valley engaged not to eat beef for seven years in order to free themselves and their descendants from feudal burdens" (*ibid.*, p. 66; the date is 1385).]

achievements, and the errors of more transcendental devotion forgiven to its rapture. But, take it for what we may, the character of this peasantry is, at least, serviceable to others and sufficient for their own peace; and in its consistency and simplicity, it stands alone in the history of the human heart. How far it was developed by circumstances of natural phenomena may also be disputed; nor should I enter into such dispute with any strongly held conviction. The Swiss have certainly no feelings respecting their mountains in anywise correspondent with ours. It was rather as fortresses of defence, than as spectacles of splendour, that the cliffs of the Rothstock¹ bare rule over the destinies of those who dwelt at their feet; and the training for which the mountain children had to thank the slopes of the Muotta-Thal, was in soundness of breath, and steadiness of limb, far more than in elevation of idea. But the point which I desire the reader to note is, that the character of the scene which, if any, appears to have been impressive to the inhabitant, is not that which we ourselves feel when we enter the district. It was not from their lakes, nor their cliffs, nor their glaciers—though these were all peculiarly their possession, that the three venerable cantons or states received their name. They were not called the States of the Rock, nor the States of the Lake, but the States of the *Forest*. And the one of the three which contains the most touching record of the spiritual power of Swiss religion, in the name of the convent of the “Hill of Angels,”² has, for its own, none but the sweet childish name of “Under the Woods.”

§ 16. And indeed you may pass under them if, leaving the most sacred spot in Swiss history, the Meadow of the

¹ [These cliffs tower above the Bay of Uri and the Meadow of Rütli, where are the Three Fountains which gushed forth from the spot on which the Three Confederates had stood on November 7, 1307 (see Vol. XIII. p. 511); it was in the Muotta-Thal that the Russians under Suwaroff were repulsed in 1799 (see Vol. XIII. p. 512).]

² [The original Forest Cantons were three—Schwyz, Uri, and Unterwalden; the fourth—Lucerne—joined them in 1332. The legend of the origin of the name Engelberg is told by Wordsworth in his *Memorials of a Tour on the Continent*, xvii.]

Three Fountains, you bid the boatman row southward a little way by the shore of the Bay of Uri.¹ Steepest there on its western side, the walls of its rocks ascend to heaven. Far in the blue of evening, like a great cathedral pavement, lies the lake in its darkness; and you may hear the whisper of innumerable falling waters return from the hollows of the cliff, like the voices of a multitude praying under their breath. From time to time the beat of a wave, slow lifted, where the rocks lean over the black depth, dies heavily as the last note of a requiem. Opposite, green with steep grass, and set with *châlet* villages, the Frohnalp rises in one solemn glow of pastoral light and peace; and above, against the clouds of twilight, ghostly on the gray precipice, stand, myriad by myriad, the shadowy armies of the Unterwalden pine.*

I have seen that it is possible for the stranger to pass through this great chapel, with its font of waters, and mountain pillars, and vaults of clouds, without being touched by one noble thought, or stirred by any sacred passion; but for those who received from its waves the baptism of their youth, and learned beneath its rocks the fidelity of their manhood, and watched amidst its clouds the likeness of the dream of life, with the eyes of age—for these I will not believe that the mountain shrine was built, or the calm of its forest-shadows guarded by their God, in vain.

* The cliff immediately bordering the lake is in Canton Uri; the green hills of Unterwalden rise above. This is the grandest piece of the shore of Lake Lucerne; the rocks near Tell's Chapel are neither so lofty nor so precipitous.

¹ [For Ruskin's own excursion here, see the Introduction, above, p. xxxiii.; and compare Vol. XIII. pp. 510–511.]

CHAPTER X

LEAVES MOTIONLESS

§ 1. It will be remembered that our final inquiry was to be into the sources of beauty in the tented plants,¹ or flowers of the field; which the reader may perhaps suppose one of no great difficulty, the beauty of flowers being somewhat generally admitted and comprehended.

Admitted? yes. Comprehended? no; and, which is worse, in all its highest characters, for many a day yet, incomprehensible: though with a little steady application, I suppose we might soon know more than we do now about the colours of flowers,—being tangible enough, and staying longer than those of clouds. We have discovered something definite about colours of opal and of peacock's plume; perhaps, also, in due time we may give some account of that true gold (the only gold of intrinsic value) which gilds buttercups; and understand how the spots are laid, in painting a pansy.²

Art of interest, when we may win any of its secrets; but to such knowledge the road lies not up brick streets. And howsoever that flower-painting may be done, one thing is certain, it is not by machinery.

§ 2. Perhaps, it may be thought, if we understood flowers better, we might love them less.

We do not love them much, as it is. Few people really care about flowers. Many, indeed, are fond of finding a new shape of blossom, caring for it as a child cares about a kaleidoscope. Many, also, like a fair service of flowers in the greenhouse, as a fair service of plate on the table. Many

¹ [See above, p. 21.]

² [For discussions of such matters, see the recent botanical works cited above, p. lix.]

are scientifically interested in them, though even these in the nomenclature¹ rather than the flowers. And a few enjoy their gardens: but I have never heard of a piece of land, which would let well on a building lease, remaining unlet because it was a flowery piece. I have never heard of parks being kept for wild hyacinths, though often of their being kept for wild beasts. And the blossoming time of the year being principally spring, I perceive it to be the mind of most people, during that period to stay in towns.²

§ 3. A year or two ago, a keen-sighted and eccentrically-minded friend of mine, having taken it into his head to violate this national custom, and go to the Tyrol in spring, was passing through a valley near Landeck, with several similarly headstrong companions. A strange mountain appeared in the distance, belted about its breast with a zone of blue, like our English Queen. Was it a blue cloud? a blue horizontal bar of the air that Titian breathed in youth, seen now far away, which mortal might never breathe again? Was it a mirage—a meteor? Would it stay to be approached? (ten miles of winding road yet between them, and the foot of its mountain). Such questioning had they concerning it. My keen-sighted friend alone maintained it to be substantial: whatever it might be, it was not air, and would not vanish. The ten miles of road were overpassed, the carriage left, the mountain climbed. It stayed patiently, expanding still into richer breadth and heavenlier glow—a belt of gentians. Such things may verily be seen among the Alps in spring, and in spring only. Which being so, I observe most people prefer going in autumn.

§ 4. Nevertheless, without any special affection for them, most of us, at least, languidly consent to the beauty of flowers, and occasionally gather them, and prefer them from among other forms of vegetation. This, strange to say, is precisely what great painters do *not*.

¹ [Compare p. 71, above.]

² [Compare *Two Paths*, § 137 (Vol. XVI. p. 372).]

Every other kind of object they paint, in its due place and office, with respect;—but, except compulsorily and imperfectly, never flowers. A curious fact this! Here are men whose lives are spent in the study of colour, and the one thing they will not paint is a flower! Anything but that. A furred mantle, a jewelled zone, a silken gown, a brazen corslet, nay, an old leathern chair, or a wall-paper if you will, with utmost care and delight;—but a flower by no manner of means, if avoidable. When the thing has perforce to be done, the great painters of course do it rightly. Titian, in his early work, sometimes carries a blossom or two out with affection, as the columbines in our *Bacchus* and *Ariadne*.¹ So also Holbein. But in his later and mightier work, Titian will only paint a fan or wristband intensely, never a flower. In his portrait of Lavinia, at Berlin, the roses are just touched finely enough to fill their place, with no affection whatever, and with the most subdued red possible; while in the later portrait of her, at Dresden, there are no roses at all, but a belt of chased golden balls, on every stud of which Titian has concentrated his strength, and I verily believe forgot the face a little, so much has his mind been set on them.²

§ 5. In Paul Veronese's *Europa*, at Dresden, the entire foreground is covered with flowers, but they are executed with sharp and crude touches like those of a decorative painter. In Correggio's paintings, at Dresden,³ and in the *Antiope* of the Louvre, there are lovely pieces of foliage, but no flowers.⁴ A large garland of oranges and lemons,

¹ [No. 35 in the National Gallery; see *Modern Painters*, vol. i. (Vol. III. p. 29).]

² [For the two Lavinias, see also above, Preface, p. 6. The Lavinia at Berlin was painted by Titian in about 1549, and represents her holding up a dish of flowers and fruit; a reproduction of it is given at p. 82 of *The Later Work of Titian*, by Claude Phillips. For the portrait of Lavinia as a bride, painted in 1553, which is at Dresden, see above, p. 6. In the same Gallery is the other portrait of Lavinia here described, painted about 1565-1570, and showing her as a matron. Compare below, p. 491.]

³ [Correggio's "St. George" is "The Madonna and Child, with St. George and other Saints": the scene is enclosed above by an arch decorated with a garland. For a note on the picture, see below, p. 492.]

⁴ [For Ruskin's note on the "superb vegetation" in Correggio's pictures at Dresden, see again below, p. 492; and for other references to the foliage in the "Antiope," see above, p. 53.]

with their leaves, above the St. George, at Dresden, is connected traditionally with the garlanded backgrounds of Ghirlandajo and Mantegna, but the studious absence of flowers renders it almost disagreeably ponderous. I do not remember any painted by Velasquez, or by Tintoret, except compulsory Annunciation lilies. The flowers of Rubens are gross and rude; those of Vandyck vague, slight, and subdued in colour, so as not to contend with the flesh.¹ In his portraits of King Charles's children, at Turin, an enchanting picture, there is a rose-thicket, in which the roses seem to be enchanted the wrong way, for their leaves are all gray, and the flowers dull brick-red. Yet it is right.²

§ 6. One reason for this is that all great men like their inferior forms to follow and obey contours of large surfaces, or group themselves in connected masses. Patterns do the first, leaves the last; but flowers stand separately.

¹ [For the foliage of Rubens, see above, p. 52; of Mantegna, *Art of England*, § 206; of Ghirlandajo, Vol. III. p. 175.]

² [In his "Notes on the Gallery of Turin" (see above, p. xxxix. n.), Ruskin has some further remarks on this picture:—

"In case I forget, note of Vandyck's three children that the sky and rose-leaves in the background are in their quiet, pretty rounded, innocent-looking forms entirely sympathetic with the little curls and caps and bossy hands and apple-like cheeks of the children; while in the Prince of Carrignano the rolling clouds and sombre thistle of the foreground are just as sympathetic with the power of the rider. This is evidently not done by any formal rule: the spirit of the painter changes with his subject; he could not have put the angry clouds behind the children; could not have painted one of their drifts in the temper he was in at the time—the creamy little tufts of cloud in the blue came as naturally to his pencil as gentleness of voice would, if he had spoken to the little people. This instinctive harmony is a great charm in all Vandyck's work. Note the intense soberness of colour in the roses of this picture—the green leaves are all grey, and the roses brick-red, bringing out the flesh colour in perfect beauty.

"One of the curious and provoking points in art criticism is that one always finds anything may be done, and justified, by a great man. Everything that one determines shouldn't be done, your great painter will some day do in your face, and laugh at you. In this Vandyck one might find a complete exemplification of all Sir Joshua's falsest rules. The roses are subdued in colour, and the draperies touched with extreme breadth and incompleteness—to bring out the children's faces more perfectly—and very wonderful it is to see the loveliness Vandyck can get out of gray and brown where anybody else would have used green and crimson.

"The more I see of painting, the more all criticism resolves itself into—this fellow *can* paint, and that fellow *can't*; and the difference between can and can't becomes in my thoughts every day more infinite and more inexplicable."]

Another reason is that the beauty of flower-petals and texture can only be seen by looking at it close; but flat patterns can be seen far off, as well as gleaming of metal-work. All the great men calculate their work for effect at some distance, and with that object, know it to be lost time to complete the drawing of flowers. Farther, the forms of flowers being determined, require a painful attention, and restrain the fancy; whereas, in painting fur, jewels, or bronze, the colour and touch may be varied almost at pleasure, and without effort.

Again, much of what is best in flowers is inimitable in painting; and a thoroughly good workman feels the feebleness of his means when he matches them fairly with Nature, and gives up the attempt frankly—painting the rose dull red, rather than trying to rival its flush in sunshine.

And, lastly, in nearly all good landscape-painting, the breadth of foreground included implies such a distance of the spectator from the nearest object as must entirely prevent his seeing flower detail.

§ 7. There is, however, a deeper reason than all these; namely, that flowers have no sublimity. We shall have to examine the nature of sublimity in our following and last section, among other ideas of relation.¹ Here I only note the fact briefly, that impressions of awe and sorrow being at the root of the sensation of sublimity, and the beauty of separate flowers not being of the kind which connects itself with such sensation, there is a wide distinction, in general, between flower-loving minds and minds of the highest order. Flowers seem intended for the solace of ordinary humanity: children love them; quiet, tender, contented ordinary people love them as they grow; luxurious and disorderly people rejoice in them gathered. they are the cottager's treasure; and in the crowded town, mark, as with a little broken fragment of rainbow, the windows of the workers in whose heart rests the covenant of peace.

¹ [The examination, however, was not very fully carried out in Part ix. ch. iii.; but compare Appendix II. 3, below, p. 481, and Appendix i. § 5 in Vol. IV. p. 369.]

Passionate or religious minds contemplate them with fond, feverish intensity; the affection is seen severely calm in the works of many old religious painters, and mixed with more open and true country sentiment in those of our own Pre-Raphaelites. To the child and the girl, the peasant and the manufacturing operative, to the grisette and the nun, the lover and monk, they are precious always.¹ But to the men of supreme power and thoughtfulness, precious only at times; symbolically and pathetically often to the poets, but rarely for their own sake. They fall forgotten from the great workmen's and soldiers' hands. Such men will take, in thankfulness, crowns of leaves, or crowns of thorns—not crowns of flowers.

§ 8. Some beautiful things have been done lately, and more beautiful are likely to be done, by our younger painters, in representing blossoms of the orchard and the field in mass and extent. I have had something to do with the encouragement of this impulse;² and truly, if pictures are to be essentially imitative rather than inventive, it is better to spend care in painting hyacinths than dead leaves, and roses rather than stubble. Such work, however, as I stated in my first essay on this subject, in the year 1851,* can only connect itself with the great schools by becoming inventive instead of copyist; and for the most part, I believe these young painters would do well to remember that the best beauty of flowers being wholly inimitable, and their sweetest service unrenderable by art, the picture involves some approach to an unsatisfying mockery in the cold imagery of what Nature has given to be breathed

* *Pre-Raphaelitism*: p. 28, and the note at p. 27; compare p. 63.³ The essay contains some important notes on Turner's work, which, therefore, I do not repeat in this volume.

¹ [Compare Vol. V. p. 372 n., and Vol. XIV. pp. 92-93.]

² [See Vol. XIV. p. xxiv.]

³ [Ruskin's references are to the first edition of the pamphlet: see in this edition Vol. XII. pp. 357-358, 388.]

with the profuse winds of spring, and touched by the happy footsteps of youth.

§ 9. Among the greater masters, as I have said, there is little laborious or affectionate flower-painting.¹ The utmost that Turner ever allows in his foregrounds is a water-lily or two, a cluster of heath or fox-glove, a thistle sometimes, a violet or daisy, or a bindweed-bell; just enough to lead the eye into the understanding of the rich mystery of his more distant leafage. Rich mystery, indeed, respecting which these following facts about the foliage of tented plants must be noted carefully.

§ 10. Two characters seem especially aimed at by nature in the earth-plants; first, that they should be characteristic and interesting; secondly, that they should not be very visibly injured by crushing.

I say, first, characteristic. The leaves of large trees take approximately simple forms, slightly monotonous. They are intended to be seen in mass. But the leaves of the herbage at our feet take all kinds of strange shapes, as if to invite us to examine them. Star-shaped, heart-shaped, spear-shaped, arrow-shaped, fretted, fringed, cleft, furrowed, serrated, sinuated; in whorls, in tufts, in spires, in wreaths, endlessly expressive, deceptive, fantastic, never the same from footstalk to blossom; they seem perpetually to tempt our watchfulness, and take delight in outstripping our wonder.

§ 11. Secondly, observe, their forms are such as will not be visibly injured by crushing. Their complexity is already disordered: jags and rents are their laws of being; rent by the footstep, they betray no harm. Here, for instance (Fig. 72), is the mere outline of a buttercup-leaf in full

¹ [The MS. here inserts an additional passage:—

“The blossoms in the Peter Martyr might be mistaken for clouds; the borage blossoms on the table in the Supper at Emmaus are distinct, but no more; and except, as I said, Annunciation lilies, it would be difficult [to find] any complete flower-painting in subsequent Venetian work.”

On the absence of “laborious or affectionate flower-painting” in the old masters and in Turner, compare Vol. XIII. p. 520. But when given, the flowers are sometimes given with great care: see Vol. III. pp. 28–29; and for Titian’s “Supper at Emmaus,” Vol. XII. p. 471.]

free growth; which, perhaps, may be taken as a good common type of earth foliage. Fig. 73 is a less advanced one, placed so as to show its symmetrical bounding form. But both, how various;—how delicately rent into beauty! As in the aiguilles of the great Alps, so in this lowest field-

Fig. 72

herb, where rending is the law of being,¹ it is the law of loveliness.

§ 12. One class, however, of these torn leaves, peculiar to the tented plants, has, it seems to me, a strange expressional function. I mean the group of leaves rent into *alternate* gaps, typically represented by the thistle. The alternation

¹ [See Vol. VI. pp. 231-237.]

of the rent, if not absolutely, is, effectively, peculiar to the earth-plants. Leaves of the builders are rent symmetrically, so as to form radiating groups, as in the horse-chestnut, or they are irregularly sinuous, as in the oak; but the earth-plants continually present forms such as those in the opposite Plate:¹ a kind of web-footed leaf, so to speak; a continuous tissue, enlarged alternately on each side of the

*Fig. 73*

stalk. Leaves of this form have necessarily a kind of limping gait, as if they grew not all at once, but first a little bit on one side, and then a little bit on the other, and wherever they occur in quantity, give the expression to foreground vegetation which we feel and call "ragged."

§ 13. It is strange that the mere alternation of the rent should give this effect; the more so, because alternate leaves, completely separate from each other, produce one of the most graceful types of building plants. Yet the fact is indeed so, that the alternate rent in the earth-leaf is the

¹ [Ruskin in his copy identifies the plant as the greater celandine.]

principal cause of its ragged effect. However deeply it may be rent symmetrically, as in the alchemilla, or buttercup just instanced, and however finely divided, as in the parsleys, the result is always a delicate richness, unless the jags are alternate, and the leaf-tissue continuous at the stem; and the moment these conditions appear, so does the raggedness.

§ 14. It is yet more worthy of note that the proper duty of these leaves, which catch the eye so clearly and powerfully, would appear to be to draw the attention of man to spots where his work is needed, for they nearly all habitually grow on ruins or neglected ground: not noble ruins, or on *wild* ground, but on heaps of rubbish, or pieces of land which have been indolently cultivated or much disturbed. The leaf on the right of the three in the Plate, which is the most characteristic of the class, is that of the *Sisymbrium Irio*,¹ which grows, by choice, always on ruins left by fire. The plant, which, as far as I have observed, grows first on earth that has been moved, is the coltsfoot: its broad covering leaf is much jagged, but only irregular, not alternate in the rent; but the weeds that mark habitual neglect, such as the thistle, give clear alternation.

§ 15. The aspects of complexity and carelessness of injury are farther increased in the herb of the field, because it is "herb yielding seed";² that is to say, a seed different in character from that which trees form in their fruit.

I am somewhat alarmed in reading over the above sentence, lest a botanist, or other scientific person, should open the book at it. For of course the essential character of either fruit or seed being only that in the smallest compass, the vital principle of the plant is rendered portable, and for some time preservable, we ought to call every such vegetable dormitory a "fruit" or a "seed" indifferently. But with respect to man there is a notable difference between them.

¹ [The London rocket.]

² [Genesis i. 11.]

A seed is what we "sow."

A fruit, what we "enjoy."

Fruit is seed prepared especially for the sight and taste of man and animals; and in this sense we have true fruit and traitorous fruit (poisonous); but it is perhaps the best available distinction,* that, seed being the part necessary for the renewed birth of the plant, a fruit is such seed enclosed or sustained by some extraneous substance, which is soft and juicy, and beautifully coloured, pleasing and useful to animals and men.

§ 16. I find it convenient in this volume, and wish I had thought of the expedient before, whenever I get into a difficulty, to leave the reader to work it out. He will perhaps, therefore, be so good as to define fruit for himself. Having defined it, he will find that the sentence about which I was alarmed above is, in the main, true, and that tented plants principally are herbs yielding seed, while building plants give fruit. The berried shrubs of rock and wood, however dwarfed in stature, are true builders. The strawberry-plant is the only important exception—a tender Bedouin.

§ 17. Of course the principal reason for this is the plain, practical one, that fruit should not be trampled on, and had better perhaps be put a little out of easy reach than too near the hand, so that it may not be gathered wantonly or without some little trouble, and may be waited for until it is properly ripe; while the plants meant to be trampled on have small and multitudinous seed, hard and wooden, which may be shaken and scattered about without harm.

Also, fine fruit is often only to be brought forth with patience: not by young and hurried trees—but in due time, after much suffering; and the best fruit is often to be

* I say the "best available distinction." It is, of course, no real distinction. A pea-pod is a kind of central type of seed and seed-vessel, and it is difficult so to define fruit as to keep clear of it. Pea-shells are boiled and eaten in some countries rather than pease. It does not sound like a scientific distinction to say that fruit is a "shell which is good without being boiled."

an adornment of old age, so as to supply the want of other grace. While the plants which will not work, but only bloom and wander, do not (except the grasses) bring forth fruit of high service, but only the seed that prolongs their race, the grasses alone having great honour put on them for their humility, as we saw in our first account of them.

§ 18. This being so, we find another element of very complex effect added to the others which exist in tented plants, namely, that of minute, granular, feathery, or downy seed-vessels, mingling quaint brown punctuation, and dusty tremors of dancing grain, with the bloom of the nearer fields; and casting a gossamer'd grayness and softness of plummy mist along their surfaces far away; mysterious evermore, not only with dew in the morning or mirage at noon, but with the shaking threads of fine arborescence, each a little belfry of grain-bells, all a-chime.

§ 19. I feel sorely tempted to draw one of these same spires of the fine grasses, with its sweet changing proportions of pendent grain, but it would be a useless piece of finesse, as such form, of course, never enters into general foreground effect.* I have, however, engraved at the top of the group of woodcuts opposite (Fig. 74), a single leaf

Nay, even if we humiliate ourselves into this practical reference to the kitchen, we are still far from success. For the pulp of a strawberry is not a "shell," the seeds being on the outside of it. The available part of a pomegranate or orange, though a seed envelope, is itself shut within a less useful rind. While in an almond the shell becomes less profitable still, and all goodness retires into the seed itself, as in a grain of corn.

* For the same reason, I enter into no consideration respecting the geometrical forms of flowers, though they are deeply interesting, and perhaps some day I may give a few studies of them separately. The reader should note, however, that beauty of form in flowers is chiefly dependent on a more accurately finished or more studiously varied development of the tre-foil, quatre-foil, and cinq-foil structures which we have seen irregularly approached by leaf-buds. The most beautiful six-foiled flowers (like the rhododendron-shoot) are composed of two triangular groups, one superimposed on the other, as in the narcissus; and the most interesting types both of six-foils and cinq-foils are unequally leaved, symmetrical on opposite sides, as the iris and violet.

61. Richmond from the Moors.

After A. J. P.

W. J. P.

cluster of Dürer's foreground in the St. Hubert,¹ which is interesting in several ways; as an example of modern work, no less than old; for it is a facsimile twice removed; being first drawn from the plate with the pen, by Mr. Allen, and then facsimiled on wood by Miss Byfield; and if the reader can compare it with the original, he will find it still come tolerably close in most parts (though the nearest large leaf has got spoiled), and of course some of the finest and most precious qualities of Dürer's work are lost. Still, it gives a fair idea of his perfectness of conception, every leaf being thoroughly set in perspective, and drawn with unerring decision. On each side of it (Figs. 75, 76) are two pieces from a fairly good modern etching,² which I oppose to the Dürer in order to show the difference between true work and that which pretends to give detail, but is without feeling or knowledge. There are a great many leaves in the piece on the left, but they are all set the same way; the draughtsman has not conceived their real positions, but draws one after another as he would deliver a tale of bricks. The grasses on the right look delicate, but are a mere series of inorganic lines. Look how Dürer's grass-blades cross each other. If you take a pen and copy a little piece of each example, you will soon feel the difference. Underneath, in the centre (Fig. 77), is a piece of grass out of Landseer's etching of the "Ladies' Pets," more massive and effective than the two lateral fragments, but still loose and uncomposed. Then underneath [Fig. 78] is a piece of firm and good work again, which will stand with Dürer's; it is the outline only of a group of leaves out of Turner's foreground in the Richmond from the Moors,³ of which I give

¹ [For other references to this Plate, see below, p. 306; Vol. XI. p. 58; *Lectures on Art*, § 47; and *Eagle's Nest*, Preface.]

² [In a MS. list of the woodcuts in this volume Ruskin calls it a "French etching," but does not otherwise identify it.]

³ [For another reference to this group of leaves, see below, p. 228; and for the drawing, "uniting the veracities both of model and photography," see the preceding volume (Vol. VI. p. 358); while for other particulars about it, Index I. in Vol. XIII. pp. 603-604. The plates have had to be further reduced somewhat for this edition; see below, Fig. 101, p. 417, for a facsimile of the hook of drapery in the foreground of Plate 61.]

a reduced etching, Plate 61, for the sake of the foreground principally, and in Plate 62, the group of leaves in question, in their light and shade, with the bridge beyond. What I have chiefly to say of them belongs to our section on composition;¹ but this mere fragment of a Turner foreground may perhaps lead the reader to take note in his great pictures of the almost inconceivable labour with which he has sought to express the redundancy and delicacy of ground leafage.

§ 20. By comparing the etching in Plate 61 with the published engraving, it will be seen how much yet remains to be done before any approximately just representation of Turner foreground can be put within the reach of the public. This Plate has been reduced by Mr. Armytage from a pen-drawing of mine, as large as the original of Turner's (18 inches by 11 inches). It will look a little better under a magnifying-glass; but only a most costly engraving of the real size could give any idea of the richness of mossy and ferny leafage included in the real design. And if this be so on one of the ordinary England drawings of a barren Yorkshire moor, it may be imagined what the task would be of engraving truly such a foreground as that of the "Bay of Baiæ" or "Daphne and Leucippus," in which Turner's aim has been luxuriance.²

§ 21. His mind recurred, in all these classical foregrounds, to strong impressions made upon him during his studies at Rome, by the masses of vegetation which enrich its heaps of ruin with their embroidery and bloom. I have always partly regretted these Roman studies,³ thinking that they led him into too great fondness of wandering luxuriance in vegetation, associated with decay; and prevented his giving affection enough to the more solemn and more sacred infinity with which, among the mightier ruins of the

¹ [In that place, however, Ruskin contents himself with a passing reference to Fig. 78 only: see p. 228, and compare p. lxiii.]

² [For other references to the "luxuriance" in these pictures (both in the National Gallery), see Vol. XIII. pp. 133, 150.]

³ [See, for instance, Vol. V. p. 392.]

62. By the Brook side.

Alpine Rome, glow the pure and motionless splendours of the gentian and the rose.

§ 22. Leaves motionless. The strong pines wave above them, and the weak grasses tremble beside them; but the blue stars rest upon the earth with a peace as of heaven; and far along the ridges of iron rock, moveless as they, the rubied crests of Alpine rose flush in the low rays of morning. Nor these yet the stillest leaves. Others there are subdued to a deeper quietness, the mute slaves of the earth, to whom we owe, perhaps, thanks, and tenderness, the most profound of all we have to render for the leaf ministries.

§ 23. It is strange to think of the gradually diminished power and withdrawn freedom among the orders of leaves—from the sweep of the chestnut and gadding of the vine, down to the close shrinking trefoil, and contented daisy, pressed on earth; and, at last, to the leaves that are not merely close to earth, but themselves a part of it; fastened down to it by their sides, here and there only a wrinkled edge rising from the granite crystals. We have found beauty in the tree yielding fruit, and in the herb yielding seed.¹ How of the herb yielding *no* seed,* the fruitless, flowerless lichen of the rock?

§ 24. Lichen, and mosses (though these last in their luxuriance are deep and rich as herbage, yet both for the most part humblest of the green things that live),—how of these? Meek creatures! the first mercy of the earth, veiling with hushed softness its dintless rocks; creatures full of pity, covering with strange and tender honour the scarred disgrace of ruin,—laying quiet finger on the trembling stones, to teach them rest. No words, that I know of, will say what these mosses are. None are delicate enough, none perfect enough, none rich enough. How

* The reader must remember always that my work is concerning the *aspects* of things only. Of course, a lichen has seeds, just as other plants have, but not effectually or visibly for man.

¹ [Genesis i. 11.]

is one to tell of the rounded bosses of furred and beaming green,—the starred divisions of rubied bloom, fine-filmed, as if the Rock Spirits could spin porphyry as we do glass,—the traceries of intricate silver, and fringes of amber, lustrous, arborescent, burnished through every fibre into fitful brightness and glossy traverses of silken change, yet all subdued and pensive, and framed for simplest, sweetest offices of grace? They will not be gathered, like the flowers, for chaplet or love-token; but of these the wild bird will make its nest, and the wearied child his pillow.

And, as the earth's first mercy, so they are its last gift to us. When all other service is vain, from plant and tree, the soft mosses and gray lichen take up their watch by the head-stone. The woods, the blossoms, the gift-bearing grasses, have done their parts for a time, but these do service for ever. Trees for the builder's yard, flowers for the bride's chamber, corn for the granary, moss for the grave.

§ 25. Yet as in one sense the humblest, in another they are the most honoured of the earth-children. Unfading, as motionless, the worm frets them not, and the autumn wastes not. Strong in lowliness, they neither blanch in heat nor pine in frost. To them, slow-fingered, constant-hearted, is entrusted the weaving of the dark, eternal tapestries of the hills; to them, slow-pencilled, iris-dyed, the tender framing of their endless imagery. Sharing the stillness of the unimpassioned rock, they share also its endurance; and while the winds of departing spring scatter the white hawthorn blossom like drifted snow, and summer dims on the parched meadow the drooping of its cowslip-gold,—far above, among the mountains, the silver lichen-spots rest, star-like, on the stone; and the gathering orange stain upon the edge of yonder western peak reflects the sunsets of a thousand years.

PART VII
OF CLOUD BEAUTY

CHAPTER I

THE CLOUD-BALANCINGS¹

§ 1. WE have seen² that when the earth had to be prepared for the habitation of man, a veil, as it were, of intermediate being was spread between him and its darkness, in which were joined, in a subdued measure, the stability and insensibility of the earth, and the passion and perishing of mankind.

But the heavens, also, had to be prepared for his habitation.

Between their burning light,—their deep vacuity, and man, as between the earth's gloom of iron substance, and man, a veil had to be spread of intermediate being;—which should appease the unendurable glory to the level of human feebleness, and sign the changeless motion of the heavens with a semblance of human vicissitude.

Between the earth and man arose the leaf. Between the heaven and man came the cloud. His life being partly as the falling leaf, and partly as the flying vapour.³

§ 2. Has the reader any distinct idea of what clouds are? We had some talk about them long ago,⁴ and perhaps thought their nature, though at that time not clear to us, would be easily enough understandable when we put ourselves seriously to make it out. Shall we begin with one or two easiest questions?

¹ [This chapter was reprinted by Ruskin in 1884 as Chapter II. of *Cæli Enarrant* (for which, see Vol. III. p. lxiii.), with a few alterations and additions, here given in their places or noted in the list above, p. lxiii.]

² [See above, ch. i., "The Earth Veil"; p. 13.]

³ [See James iv. 14. Compare Vol. XIII. p. 316.]

⁴ [In the first volume of *Modern Painters*.]

That mist¹ which lies in the morning so softly in the valley, level and white, through which the tops of the trees rise as if through an inundation—why is *it* so heavy? and why does it lie so low, being yet so thin and frail that it will melt away utterly into splendour of morning, when the sun has shone on it but a few moments more? Those colossal pyramids, huge and firm, with outlines as of rocks, and strength to bear the beating of the high sun full on their fiery flanks—why are *they* so light,—their bases high over our heads, high over the heads of Alps? why will these melt away, not as the sun *rises*, but as he *descends*, and leave the stars of twilight clear, while the valley vapour gains again upon the earth like a shroud?

Or that ghost of a cloud, which steals by yonder clump of pines: nay, which does *not* steal by them, but haunts them, wreathing yet round them, and yet—and yet, slowly: now falling in a fair waved line like a woman's veil; now fading, now gone: we look away for an instant, and look back, and it is again there.² What has it to do with that clump of pines, that it broods by them and weaves itself among their branches, to and fro? Has it hidden a cloudy treasure among the moss at their roots, which it watches thus? Or has some strong enchanter charmed it into fond returning, or bound it fast within those bars of bough? And yonder filmy crescent, bent like an archer's bow above the snowy summit, the highest of all the hill,—that white arch which never forms but over the supreme crest,—how is it stayed there, repelled apparently from the snow—nowhere touching it, the clear sky seen between it and the

¹ [§ 2 (with the omission of the words "We had some talk . . . easiest questions") is part of § 24 in *Fronde Agrestes* (1875), where it follows passages about the clouds from the first volume of *Modern Painters*. At this point in *Fronde* Ruskin adds the footnote:—

"This is a fifth volume bit, and worth more attention."]

² [As an instance of the care with which every sentence of these chapters was revised, the MS. version of this passage may be given:—

"Or that ghost of a cloud, which wraps itself about yonder tuft of pines: nay, which does not steal by it, but haunts it, wreathing still round it, and yet—and yet so slowly: like a woman's veil; now fading, now gone: we look away for an instant, and back again, and behold it is again there."]

mountain edge, yet never leaving it—poised as a white bird hovers over its nest?

Or those war-clouds that gather on the horizon, dragon-crested, tongued with fire;—how is their barbed strength bridled? what bits are these they are champing with their vaporous lips; flinging off flakes of black foam? Leagued leviathans of the Sea of Heaven, out of their nostrils goeth smoke, and their eyes are like the eyelids of the morning. The sword of him that layeth at them cannot hold; the spear, the dart, nor the habergeon.¹ Where ride the captains of their armies? Where are set the measures of their march? Fierce murmurers, answering each other from morning until evening—what rebuke is this which has awed them into peace? what hand has reined them back by the way by which they came?

§ 3. I know not if the reader will think at first that questions like these are easily answered. So far from it, I rather believe that some of the mysteries of the clouds never will be understood by us at all. “Knowest thou the balancings of the clouds?” Is the answer ever to be one of pride? “The wondrous works of Him which is *perfect* in knowledge?”² Is *our* knowledge ever to be so?

It is one of the most discouraging consequences of the varied character of this work of mine, that I am wholly unable to take note of the advance of modern science. What has conclusively been discovered or observed about clouds, I know not; but by the chance inquiry possible to me I find no book which fairly states the difficulties of accounting for even the ordinary aspects of the sky. I shall, therefore, be able in this section to do little more than suggest inquiries to the reader, putting the subject in a clear form for him. All men accustomed to investigation will confirm me in saying that it is a great step when we are personally quite certain what we do *not* know.

¹ [Job xli. 18, 20, 26.]

² [Job xxxvii. 16.]

§ 4. First, then, I believe we do not know what makes clouds float. Clouds are water, in some fine form or another; but water is heavier than air, and the finest form you can give a heavy thing will not make it float in a light thing.¹ *On* it, yes; as a boat; but *in* it, no. Clouds are not boats, nor boat-shaped; and they float in the air, not on the top of it. "Nay, but though unlike boats, may they not be like feathers? If out of quill substance there may be constructed eider-down, and out of vegetable tissue, thistle-down, both buoyant enough for a time, surely of water-tissue may be constructed also water-down, which will be buoyant enough for all cloudy purposes." Not so. Throw out your eider plumage in a calm day, and it will all come settling to the ground: slowly indeed, to aspect; but practically so fast that all our finest clouds would be here in a heap about our ears in an hour or two, if they were only made of water-feathers. "But may they not be quill feathers, and have air inside them? May not all their particles be minute little balloons?"

A balloon only floats when the air inside it is either specifically, or by heating, lighter than the air it floats in. If the cloud-feathers had warm air inside their quills, a cloud would be warmer than the air about it, which it is not (I believe). And if the cloud-feathers had hydrogen inside their quills, a cloud would be unwholesome for breathing, which it is not—at least so it seems to me.

"But may they not have nothing inside their quills?" Then they would rise, as bubbles do through water, just as certainly as, if they were solid feathers, they would fall. All

¹ [Here in *Cæli Enarrant* (1884) Ruskin added the following footnote:—

"Compare the old note to § 6 [p. 138]; but I had not, when I wrote it, enough reflected on the horrible buoyancy of smoke, nor did I know over what spaces volcanic ashes were diffusible. Will any of my scientific friends now state for me the approximate weight and bulk of a particle of dust of any solid substance which would be buoyant in air of a given density?"

For the answer to this question, see the Postscript of 1884; below, p. 141. Ruskin repeated his questions in *The Storm-Cloud of the Nineteenth Century*, 1884, p. 76. For some later notes on such questions, see the extracts from Ruskin's letters to Kate Greenaway, given in the Introduction; above, p. lxi.]

our clouds would go up to the top of the air, and swim in eddies of cloud-foam.

"But is not that just what they do?" No. They float at different heights, and with definite forms, in the body of the air itself. If they rose like foam, the sky on a cloudy day would look like a very large flat glass of champagne seen from below, with a stream of bubbles (or clouds) going up as fast as they could to a flat foam-ceiling.

"But may they not be just so nicely mixed out of something and nothing, as to float where they are wanted?"

Yes; that is just what they not only may, but must be: only this way of mixing something and nothing is the very thing I want to explain or have explained, and cannot do it, nor get it done.

§ 5. Except thus far. It is conceivable that minute hollow spherical globules might be formed of water, in which the enclosed vacuity just balanced the weight of the enclosing water, and that the arched sphere formed by the watery film was strong enough to prevent the pressure of the atmosphere from breaking it in. Such a globule would float like a balloon at the height in the atmosphere where the equipoise between the vacuum it enclosed, and its own excess of weight above that of the air, was exact. It would, probably, approach its companion globules by reciprocal attraction, and form aggregations which might be visible.¹

This is, I believe, the view usually taken by meteorologists. I state it as a possibility, to be taken into account in examining the question—a possibility confirmed by the Scriptural words which I have taken for the title of this chapter.

§ 6. Nevertheless, I state it as a possibility only, not seeing how any known operation of physical law could explain the formation of such molecules. This, however, is not the only difficulty. Whatever shape the water is thrown into, it seems at first improbable that it should lose its

¹ [For a note by Sir Oliver Lodge on this passage, see the Postscript, below, p. 142.]

property of wetness. Minute division of rain, as in "Scotch mist," makes it capable of floating farther,* or floating up and down a little, just as dust will float, though pebbles will not; or gold-leaf, though a sovereign will not; but minutely divided rain wets as much as any other kind, whereas a cloud, partially always, sometimes entirely, loses its power of moistening. Some low clouds look, when you are in them, as if they were made of specks of dust, like short hairs; and these clouds are entirely dry. And also many clouds will wet some substances, but not others. So that we must grant farther, if we are to be happy in our theory, that the spherical molecules are held together by an attraction which prevents their adhering to any foreign body, or perhaps ceases only under some peculiar electric conditions.

§ 7. The question remains, even supposing their production accounted for,—What intermediate states of water may exist between these spherical hollow molecules and pure vapour?

* The buoyancy of solid bodies of a given specific gravity, in a given fluid, depends, first on their size, then on their forms.

First, on their size; that is to say, on the proportion of the magnitude of the object (irrespective of the distribution of its particles) to the magnitude of the particles of the air.

Thus, a grain of sand is buoyant in wind, but a large stone is not; and pebbles and sand are buoyant in water in proportion to their smallness, fine dust taking long to sink, while a large stone sinks at once. Thus we see that water may be arranged in drops of any magnitude, from the largest rain-drop, about the size of a large pea, to an atom so small as not to be separately visible, the smallest rain passing gradually into mist. Of these drops of different sizes (supposing the strength of the wind the same), the largest fall fastest, the smaller drops are more buoyant, and the small misty rain floats about like a cloud, as often up as down, so that an umbrella is useless in it; though in a heavy thunderstorm, if there is no wind, one may stand gathered up under an umbrella without a drop touching the feet.

Secondly, buoyancy depends on the amount of surface which a given weight of the substance exposes to the resistance of the substance it floats in. Thus, gold-leaf is in a high degree buoyant, while the same quantity of gold in a compact grain would fall like a shot; and a feather is buoyant, though the same quantity of animal matter in a compact form would be as heavy as a little stone. A slate blows far from a house-top, while a brick falls vertically, or nearly so.

Has the reader ever considered the relations of commonest forms of volatile substance? The invisible particles which cause the scent of the rose-leaf, how minute, how multitudinous, passing richly away into the air continually! The visible cloud of frankincense—why visible? Is it in consequence of the greater quantity, or larger size of the particles, and how does the heat act in throwing them off in this quantity. or of this size?

Ask the same questions respecting water. It dries, that is, becomes volatile, invisibly, at (any?) temperature. Snow dries, as water does. Under increase of heat, it volatilizes faster, so as to become dimly visible in large mass, as a heat-haze. It reaches boiling point, then becomes entirely visible. But compress it, so that no air shall get between the watery particles—it is invisible again. At the first issuing from the steam-pipe the steam is transparent; but opaque, or visible, as it diffuses itself. The water is indeed closer, because cooler, in that diffusion; but more air is between its particles. Then this very question of visibility is an endless one, wavering between form of substance and action of light. The clearest (or least visible) stream becomes brightly opaque by more minute division in its foam, and the clearest dew in hoar-frost. Dust, unperceived in shade, becomes constantly visible in sunbeam; and watery vapour in the atmosphere, which is itself opaque, when there is promise of fine weather, becomes exquisitely transparent; and (questionably) blue when it is going to rain.

§ 8. Questionably blue: for besides knowing very little about water, we know what, except by courtesy, must, I think, be called nothing—about air. Is it the watery vapour, or the air itself, which is blue? Is neither blue, but only white, producing blue when seen over dark spaces? If either blue, or white, why, when crimson is their commanded dress, are the most distant clouds crimsonest? Clouds close to us may be blue, but far off golden—a strange result, if the air is blue. And again, if blue, why are rays that come through large spaces of it red; and that

Alp, or anything else that catches far away light, why coloured red, at dawn and sunset? No one knows, I believe. It is true that many substances, as opal, are blue, or green, by reflected light, yellow by transmitted; but air, if blue at all, is blue always by transmitted light. I hear of a wonderful solution of nettles, or other unlovely herb, which is green when shallow,—red when deep.¹ Perhaps some day, as the motion of the heavenly bodies by help of an apple, their light by help of a nettle, may be explained to mankind.

§ 9. But farther: these questions of volatility, and visibility, and hue, are all complicated with those of shape. How is a cloud outlined? Granted whatever you choose to ask, concerning its material, or its aspect, its loftiness and luminousness,—how of its limitation? What hews it into a heap, or spins it into a web? Cold is usually shapeless, I suppose, extending over large spaces equally, or with gradual diminution. You cannot have, in the open air, angles, and wedges, and coils, and cliffs of cold. Yet the vapour stops suddenly, sharp and steep as a rock, or thrusts itself across the gates of heaven in likeness of a brazen bar; or braids itself in and out, and across and across, like a tissue of tapestry; or falls into ripples like sand; or into waving shreds and tongues, as fire. On what anvils and wheels is the vapour pointed, twisted, hammered, whirled, as the potter's clay? By what hands is the incense of the sea built up into domes of marble?²

And, lastly, all these questions respecting substance, and aspect, and shape, and line, and division, are involved with others as inscrutable, concerning action. The curves in which clouds move are unknown;—nay, the very method of their motion, or apparent motion, how far it is by change of place, how far by appearance in one place and vanishing from another. And these questions about movement lead

¹ [Ruskin here seems to be referring to the phenomena of fluorescence; see under that heading in the article upon "Light" in the *Encyclopædia Britannica*, vol. ix. p. 602 (9th edition).]

² [Compare *The Storm-Cloud of the Nineteenth Century*, where Ruskin again raises similar questions, and quotes this § 9. Compare also *Eagle's Nest*, § 131.]

partly far away into high mathematics, where I cannot follow them, and partly into theories concerning electricity and infinite space, where I suppose at present no one can follow them.

What, then, is the use of asking the questions?

For my own part, I enjoy the mystery, and perhaps the reader may. I think he ought. He should not be less grateful for summer rain, or see less beauty in the clouds of morning, because they come to prove him with hard questions; to which, perhaps, if we look close at the heavenly scroll,* we may find also a syllable or two of answer illuminated here and there.

POSTSCRIPT [1884]¹

I AM happy in finding that the saucy saying in my Preface, "I find nothing to alte.," must even already be withdrawn; and that probably every chapter henceforward may have its postscript of correction or addition, bringing it to due level with the state of modern science. I had not hoped to have time for this revision; but by the kindness of Professor Oliver Lodge, of University College, Liverpool,² I have been at once put in possession of the facts bearing on all main points in immediate question,—with the farther permission to refer to him as others occur. To begin with, he tells me, respecting the buoyancy of dust in the atmosphere, and its functions there (see above, the note at p. 138), many more things than can be dealt with in a postscript,—they must be considered in their proper places in additional chapters,—and at once relieves me from farther trouble

* There is a beautiful passage in *Sartor Resartus* concerning this old Hebrew scroll, in its deeper meanings, and the child's watching it, though long illegible for him, yet "with an eye to the gilding." It signifies in a word or two nearly all that is to be said about clouds.³

¹ [This postscript was put into type by Ruskin for *Cæli Enarrant*, but the publication of that reprint from *Modern Painters* was suspended before the Part, in which the postscript was to be included, had appeared—headed "Postscript to Chapter II." (i.e., of *Cæli*, ch. i. of Part vii. here). The "Preface" referred to is in this edition printed at the end of the fourth volume of *Modern Painters* (Vol. VI. pp. 486, 487).]

² [Now Sir Oliver Lodge, Principal of the Birmingham University.]

³ [See Book ii. ch. ii. of *Sartor*. In *Cæli Enarrant* Ruskin added at the end of his note "... (Not quite. J. R., 1884)," and this addition was incorporated in the edition of 1888 and later.]

or error about floating bubbles by his following note on the fifth paragraph of the second chapter:¹—"A sphere of perfectly flexible, inextensible and incompressible substance *would* stand pressure exactly as you suggest,—not so when it is compressible, and so absolutely compressible as a water-film would be: collapsible, not because it is crumpled, but because its walls thicken, and its internal cavity instantly closes. A *free* globule must be spherical, and cannot be a hollow sphere."

Professor Lodge has also explained to me for the first time the expansion of aqueous vapour (as of other gaseous elements) independently of the air. I had always imagined that dry air sucked up water into the pores of it, like a sponge, and was saturated with water as water is by salt. (See the expression to that effect in the first paragraph of the following chapter.) The real fact, of immense importance to us in future conclusions, I have not recovered enough from my astonishment—not to say consternation—in learning, to follow out, yet, to any conclusions, but I give them at once in Professor Lodge's words:—"The amount of water which is able to evaporate into a space of a thousand cubic feet" (or any other fixed number, a thousand being only the term of my question) "depends entirely on the temperature, and on nothing else. It does not depend on the quantity of air in the vessel. Whether it be high-pressure air or low-pressure air, or vacuum, or any other dry gas or mixture of gases, all these things matter nothing,—they do not affect the quantity of water which evaporates; they do affect the rapidity with which the process takes place, as we shall see later, but they do not affect its ultimate amount. The distribution of moisture through the air is brought about by 'diffusion' aided by 'convection.' The molecules or atoms of matter (I draw no distinction between 'atoms' and molecules for present purposes) in the *liquid* state are mutually connected or bound in some way, and they are very close together; they are commonly said to be 'within range of each other's attraction,' and there is sound meaning involved in this rather uncomfortable phrase. They are believed (known, I might say) to be in rapid motion of some kind, but they are so clogged by the crowd of others that *loco*-motion is extremely slow. But the molecules or atoms of a vapour or gas are almost or quite free from each other's influence, and the motion of these consists in rushing wildly about—striking against obstacles and rebounding—but, except during collision, pursuing a straight path with a velocity comparable to that of a rifle bullet. (This molecular velocity is accurately known for different gases, and depends, for any one gas, solely on temperature. Here is a little table of these velocities at the freezing-point of water:—

Hydrogen	6110 feet a second		
Oxygen	1525	"	"
Carbonic acid	1250	"	"
Steam	2035	"	")."

I have not yet been able to master the idea of this state of things, and still less that of the communicable agitation of fluorescence, shown

¹ [The "second chapter" in *Cæli Enarrant*; see here, p. 137.]

me by Mr. Huggins,¹ to whom, being happily for me my neighbour when I am in London, I can have recourse for safety in what I say or think about light. Meantime I go on with my old book, exulting now in the hope of at last appeasing some of its thirsty questions, and massing what statements in it I may get leave to ratify in more useful and intelligible order.

¹ [Sir William Huggins, K.C.B., President of the Royal Society; he had built his private observatory at 90 Upper Tulse Hill in 1856.]

CHAPTER II

THE CLOUD-FLOCKS¹

§ 1. FROM the tenor of the foregoing chapter, the reader will, I hope, be prepared to find me, though dogmatic (it is said) upon some occasions,² anything rather than dogmatic respecting clouds. I will assume nothing concerning them, beyond the simple fact, that as a floating³ sediment forms in a saturated liquid, vapour forms in the body of the air; and all that I want the reader to be clear about, in the outset, is that this vapour floats *in* and *with* the wind (as, if you throw any thick colouring-matter into a river, it floats with the stream), and that it is not blown before a denser volume of the wind, as a fleece of wool would be.

§ 2. At whatever height they form, clouds may be broadly considered as of two species only, massive and striated. I cannot find a better word than massive, though it is not a good one, for I mean it only to signify a fleecy arrangement in which no *lines* are visible. The fleece may be so bright as to look like flying thistle-down, or so diffused as to show no visible outline at all. Still if it is all of one common texture, like a handful of wool, or a wreath of smoke, I call it massive.

On the other hand, if divided by parallel lines, so as to look more or less like spun-glass, I call it striated. In

¹ [Among Ruskin's papers is a proof and revise of this chapter which he intended to print as a further chapter in *Cæli Enarrant* (see above, p. lxi.). The proof contains a few alterations and added notes, which are here given in their places or noted in the list of "*Variae Lectiones*" (p. lxxiii.). For the title of the present chapter, see below, § 5.]

² [Compare *Time and Tide*, § 33, and *Fors Clavigera*, Letter 85.]

³ [Here, for *Cæli Enarrant*, Ruskin added the following footnote:—

"More accurately 'suspended'; see postscript to preceding chapter."]

Plate 69,¹ Fig. 4, the top of the Aiguille Dru (Chamouni) is seen emergent above low striated clouds, with heaped massive cloud beyond. I do not know in the least what causes this striation, except that it depends on the nature of the cloud, not on the wind. The strongest wind will not throw a cloud, massive by nature, into the linear form. It will toss it about, and tear it to pieces, but not spin it into threads. On the other hand, often without any wind at all, the cloud will spin itself into threads fine as gossamer. These threads are often said to be a prognostic of storm; but they are not *produced* by storm.

§ 3. In the first volume, we considered all clouds as belonging to three regions, that of the cirrus, the central cloud, and the rain-cloud.² It is of course an arrangement more of convenience than of true description, for cirrus clouds sometimes form low as well as high; and rain sometimes falls high as well as low. I will, nevertheless, retain this old arrangement, which is practically as serviceable as any.

Allowing, also, for various exceptions and modifications, these three bodies of cloud may be generally distinguished in our minds thus. The clouds of upper region are for the most part quiet, or seem to be so, owing to their distance. They are formed now of striated, now of massive substance; but *always finely divided*.³ The central clouds are entirely of massive substance, but divided into large ragged flakes or ponderous heaps. These heaps (cumuli) and flakes, or drifts, present different phenomena, but must be joined in our minds under the head of central cloud. The lower clouds, bearing rain abundantly, are composed partly of striated, partly of massive substance; but may generally be comprehended under the term "rain-cloud."

¹ [Opposite p. 166. In the proof for *Cœli Enarrant* this was "In Plate I. (Atlas), Fig. 4," thus showing that Ruskin intended to issue, as a companion volume, to his reprints from *Modern Painters*, a series of separate Plates.]

² [See Vol. III. p. 359.]

³ [In the proof for *Cœli Enarrant* Ruskin here added the following footnote:—

"See the correction of this too general statement in note to section 4."]

Our business in this chapter then is with the upper clouds, which, owing to their quietness and multitude, we may perhaps conveniently think of as the "cloud-flocks." And we have to discover if any laws of beauty attach to them, such as we have seen in mountains or tree-branches.

§ 4. On one of the few mornings of this winter,¹ when the sky was clear, and one of the far fewer, on which its clearness was visible from the neighbourhood of London,—which now entirely loses at least two out of three sunrises, owing to the environing smoke,—the dawn broke beneath a broad field of level purple cloud,² under which floated ranks of divided cirri, composed of finely striated vapour.

It was not a sky containing any extraordinary number of these minor clouds; but each was more than usually distinct in separation from its neighbour, and as they showed in nearly pure pale scarlet on the dark purple ground, they were easily to be counted.

§ 5. There were five or six ranks, from the zenith to the horizon; that is to say, three distinct ones, and then two or three more running together, and losing themselves in distance, in the manner roughly shown in Fig. 79. The nearest rank was composed of more than 150 rows of cloud, set obliquely, as in the figure. I counted 150, which was near the mark, and then stopped, lest the light should fail, to count the separate clouds in some of the rows. The average number was 60 in each row, rather more than less.

Fig. 79

¹ [In the proof for *Cæli Enarrant* Ruskin here inserted the date "(1859-60)." For his study of skies at Denmark Hill, see above, Introduction, p. xxvi.]

² [Here in the proof for *Cæli Enarrant* Ruskin added the following footnote :—

"Curiously, my first instance contradicts my first italicized generalization, that the upper clouds are *always* finely divided,—for this level purple cloud was higher, since it served as a ground for the cirri described, yet it was broad and unbroken. I ought to have said, 'finely divided if divided at all'—and even that is not true of the spaces left by openings in their level fields. It is true only that they are never massive, usually of small horizontal depth,—and characteristically subject to multiplied division."]

1000000

1000000
1000000

63. The Cloud Flocks.

There were therefore 150×60 , that is, 9,000, separate clouds in this one rank, or about 50,000 in the field of sight. Flocks of Admetus under Apollo's keeping.¹ Who else could shepherd such? He by day, dog Sirius by night; or huntress Diana herself—her bright arrows driving away the clouds of prey that would ravage her fair flocks. We

Fig. 80

must leave fancies, however; these wonderful clouds need close looking at. I will try to draw one or two of them before they fade.

§ 6. On doing which (Fig. 80) we find, after all, they are not much more like sheep than *Canis Major* is like a dog. They resemble more some of our old friends, the pine branches, covered with snow. The three, forming the uppermost figure, in the Plate opposite, are as like three of

¹ [For the story of Apollo, when banished from heaven, tending the flocks of Admetus, see Euripides, *Alcestis*, 569 seq.]

the fifty thousand as I could get them; complex enough in structure, even this single group. Busy workers they must be, that twine the braiding of them all to the horizon, and down beyond it.

And who are these workers? You have two questions here, both difficult. What separates these thousands of clouds each from the other, and each about equally from the other? How can they be drawn asunder, yet not allowed to part? Looped lace as it were, richest point—invisible threads fastening embroidered cloud to cloud—the “*plighted* clouds” of Milton,—creatures of the element—

“That in the colours of the rainbow live,
And play in the plighted clouds.”¹

Compare Geraldine dressing:—

“Puts on her silken vestments white,
And tricks her hair in lovely plight.”

And Britomart’s—

“Her well-plighted frock
She low let fall, that flowed from her lanck side,
Down to her foot with careless modesty.”

And, secondly, what bends each of them into these flame-like curves, tender and various, as motions of a bird, hither and thither? Perhaps you may hardly see the curves well in the softly finished forms; here they are plainer in rude outline, Fig. 80.*

* Before going farther, I must say a word or two respecting methods of drawing clouds.

Absolutely well no cloud *can* be drawn with the point; nothing but the most delicate management of the brush will express its variety of edge

¹ [*Comus*, line 298. (For a reference to the word *plighted* in this passage, see a letter to Dr. Furnivall of September 29, 1878, printed in *Arrows of the Chase*, 1880, ii. 260, and reprinted in a later volume of this edition.) In the proof for *Cæli Enarrant* Ruskin here added the following footnote:—

“I do not doubt that Milton had seen, before any of us, the rainbow colours in the plighted clouds themselves. See lectures on ‘Storm Cloud,’ i. p. 27. For this use of the word plight, ‘Compare Geraldine dressing:—
. . . careless modesty.’”

For Geraldine, see Coleridge’s *Christabel*, part ii.; and for Britomart, *Fæerie Queene*, book iii. canto ix. 21.]

§ 7. What is it that throws them into these lines?
Eddies of wind?

Nay, an eddy of wind will not stay quiet for three minutes, as that cloud did to be drawn; as all the others did, each in his place. You see there is perfect harmony among the curves. They all flow into each other as the

and texture. By laborious and tender engraving, a close approximation may be obtained either to nature or to good painting; and the engravings of sky by our modern line engravers are often admirable;—in many respects as good as can be, and to my mind the best part of their work. There still exist some early proofs of Miller's Plate of the Grand Canal, Venice,¹ in which the sky is the likeliest thing to Turner's work I have ever seen in large engravings. The Plate was spoiled after a few impressions were taken off by desire of the publisher. The sky was so exactly like Turner's that he thought it would not please the public, and had all the fine cloud-drawing rubbed away to make it soft.

The Plate² opposite this page, by Mr. Armytage, is also, I think,³ a superb specimen of engraving, though, in result, not so good as the one just spoken of, because this was done from my copy of Turner's sky, not from the picture itself.

But engraving of this finished kind cannot, by reason of its costliness, be given for every illustration of cloud-form. Nor, if it could, can skies be sketched with the completion which would bear it. It is sometimes possible to draw one cloud out of fifty thousand with something like fidelity before it fades. But if we want the arrangement of the fifty thousand, they can only be indicated with the rudest lines, and finished from memory. It was, as we shall see presently, only by his gigantic powers of memory that Turner was enabled to draw skies as he did.

Now I look upon my own memory of clouds, or of anything else, as of no value whatever.⁴ All the drawings on which I have ever rested an assertion have been made without stirring from the spot; and in sketching clouds from nature, it is very seldom desirable to use the

¹ [The picture referred to is "Venice from the Porch of Madonna della Salute"; for particulars of it, and of Miller's engraving, see Vol. XIII. p. 498 (a note on a fine early impression of the Plate exhibited by Ruskin in 1878-1879).]

² [For a further reference to this Plate, see again Vol. XIII. pp. 498-499 (a note on the Plate exhibited by Ruskin on the same occasion).]

³ [In the proof for *Cæli Enarrant* Ruskin struck out the words "I think."]

⁴ [Here in the proof for *Cæli Enarrant* Ruskin added:—

"... no value whatever. (This statement is one of those which I do admit require some slight modification in this final edition. By value I mean evidence in court; and neither of conversations, events, nor aspects of things, do I ever allege what I have not made memoranda of on the instant.) All the drawings..."

Compare *Fors Clavigera*, Letter 94, where Ruskin says, "I myself have written down memoranda of many skies, but have forgotten the skies themselves. Turner wrote nothing,—but remembered all."]

currents of a stream do. If you throw dust that will float on the surface of a slow river, it will arrange itself in lines somewhat like these. To a certain extent, indeed, it is true that there are gentle currents of change in the atmosphere, which move slowly enough to permit in the clouds that follow them some appearance of stability. But how to obtain change so complex in an infinite number of consecutive spaces;—fifty thousand separate groups of current in half of a morning sky, with quiet invisible vapour between, or none;—and yet all obedient to one ruling law, gone forth through their companies;—each marshalled to their white standards, in great unity of warlike march, unarrested, unconfused? “One shall not thrust another, they shall walk every one in his own path.”¹

brush. For broad effects and notes of colour (though these, hastily made, are always inaccurate, and letters indicating the colour do nearly as well) the brush may be sometimes useful; but, in most cases, a dark pencil, which will lay shade with its side and draw lines with its point, is the best instrument. Turner almost always outlined merely with the point, being able to remember the relations of shade without the slightest chance of error. The point, at all events, is needful, however much stump work may be added to it.

Now, in translating sketches made with the pencil point into engraving, we must either engrave delicately and expensively, or be content to substitute for the soft varied pencil lines the finer and uncloudlike touches of the pen. It is best to do this boldly, if at all, and without the least aim at fineness of effect, to lay down a vigorous black line as the limit of the cloud-form or action. The more subtle a painter's finished work, the more fearless he is in using the vigorous black line when he is making memoranda, or treating his subject conventionally. In Fig. 66 Vol. IV.,² the reader may see the kind of outline which Titian uses for clouds in his pen work. Usually he is even bolder and coarser. And in the rude woodcuts I am going to employ here, I believe the reader will find ultimately that, with whatever ill success used by me, the means of expression are the fullest and most convenient that can be adopted, short of finished engraving, while there are some conditions of cloud-action which I satisfy myself better in expressing by these coarse lines than in any other way.

¹ [Joel ii. 8. In the proof for *Cæli Enarrant* Ruskin added the following footnote:—

“This favourite text is again used of the cumulus, in the passage quoted from *Fors*—‘Storm Cloud,’ i. p. 41.”

The passage referred to is quoted not from *Fors*, but from *Eagle's Nest* (§ 130).]

² [In this edition, Vol. VI. p. 268.]

§ 8. These questions occur, at first sight, respecting every group of cirrus cloud. Whatever the form may be, whether branched, as in this instance, or merely rippled, or thrown into oval masses,¹ as in Fig. 81—a frequent arrangement—there is still the same difficulty in accounting satisfactorily for the individual forces which regulate the similar shape of each mass, while all are moved by a general force that has apparently no influence on the divided structure. Thus the mass of clouds disposed as in Fig. 81 will probably move, mutually, in the direction of the arrow; that is to say, sideways, as far as their separate curvature is concerned. I suppose it probable that as the science of electricity is more perfectly systematized, the explanation of many circumstances of cloud-form will be rendered by it. At present I see no use in troubling the reader or myself with conjectures which a year's progress in science might either effectively contradict or supersede. All that I want is, that we should have our questions ready to put clearly to the electricians when the electricians are ready to answer us.

Fig. 81

§ 9. It is possible that some of the loveliest conditions of these parallel clouds may be owing to a structure which I forgot to explain, when it occurred in rocks, in the course of the last volume.

When they are finely stratified, and their surfaces abraded by broad, shallow furrows, the edges of the beds, of course, are thrown into undulations, and at some distance, where the furrows disappear, the surface looks as if the rock had flowed over it in successive waves. Such a condition is seen on the left at the top in Fig. 17 in Vol. IV.²

¹ [“Oval masses” is a correction from Ruskin’s proof for *Cæli Enarrant*, where he added as a footnote:—

“Shield-like segments in the old book, which was nonsense.”]

² [In this edition, Vol. VI. p. 193.]

Supposing a series of beds of vapour cut across by a straight sloping current of air, and so placed as to catch the light on their edges, we should have a series of curved lights, looking like independent clouds.

§ 10. I believe conditions of form like those in Fig. 82 (turn the book with its outside edge down) may not unfrequently be thus, owing to stratification, when they occur in the nearer sky. This line of cloud is far off at the horizon, drifting towards the left (the points of course forward), and is, I suppose, a series of nearly circular eddies seen in perspective.

Which question of perspective we must examine a little before going a step farther.¹

In order to simplify it, let us assume that the under surfaces of clouds are flat, and lie in a horizontal extended field. This is in great measure the fact, and notable perspective phenomena depend on the approximation of clouds to such a condition.

§ 11. Referring the reader to my *Elements of Perspective*² for statements of law which would be in this place tiresome, I can only ask him to take my word for it that the three figures in Plate 64 represent limiting lines of sky perspective, as they would appear over a large space of the sky. Supposing that the breadth included was one-fourth of the horizon, the shaded portions in the central figure represent square fields of cloud,* and

* If the figures are supposed to include less than one-fourth of the horizon, the shaded figures represent diamond-shaped clouds; but the reader cannot understand this without studying perspective laws accurately.

¹ [In the proof for *Cæli Enarrant* Ruskin omitted from "Which question of perspective" down to "parallel lines" (line 12 of § 12), putting the following footnote:—

"I omit in this place four paragraphs on the perspectives, with the plates illustrating them, in which I never heard any one express the slightest interest, or intimate that they had put them to any use."
He retained from "In Plate 66" (line 13 of § 12) down to "becomes embarrassing" (line 4 of § 13), and then omitted from "The central figure" (line 5) down to "including curve; and" (line 13 of § 14), resuming "... embarrassing. A common painter . . ."]

61. Cloud Perspective (Rectilinear).

those in the uppermost figure narrow triangles, with their shortest side next us, but sloping a little away from us.

In each figure, the shaded portions show the perspective limits of cloud-masses, which, in reality, are arranged in perfectly straight lines, are all similar, and are equidistant from each other. Their exact relative positions are marked by the lines connecting them, and may be determined by the reader if he knows perspective. If he does not, he may be surprised at first to be told that the stubborn and blunt little triangle, *b*, Fig. 1, Plate 64, represents a cloud precisely similar, and similarly situated, to that represented by the thin triangle. *a*; and, in like manner, the stout diamond, *a*, Fig. 2, represents precisely the same form and size of cloud as the thin strip at *b*. He may perhaps think it still more curious that the retiring perspective which causes stoutness in the triangle, causes leanness in the diamond.*

§ 12. Still greater confusion in aspect is induced by the apparent change caused by perspective in the direction of the wind. If Fig. 3 [Plate 64] be supposed to include a quarter of the horizon, the spaces, into which its straight lines divide it, represent squares of sky. The curved lines, which cross these spaces from corner to corner, are precisely parallel throughout; and, therefore, two clouds moving, one on the curved line from *a* to *b*, and the other on the other side, from *c* to *d*, would, in

Fig. 32

* In reality, the retiring ranks of cloud, if long enough, would, of course, go on converging to the horizon. I do not continue them, because the figures would become too compressed.

reality, be moving with the same wind, in parallel lines. In Plate 66, which is a sketch of an actual sunset behind Beauvais cathedral (the point of the roof of the apse, a little to the left of the centre, shows it to be a summer sunset), the white cirri in the high light are all moving eastward, away from the sun, in perfectly parallel lines, curving a little round to the south. Underneath, are two straight ranks of rainy cirri, crossing each other; one directed south-east; the other, north-west. The meeting perspective of these, in extreme distance, determines the shape of the angular light which opens above the cathedral. Underneath all, fragments of true rain-cloud are floating between us and the sun, governed by curves of their own. They are, nevertheless, connected with the straight cirri by the dark semi-cumulus in the middle of the shade above the cathedral.

§ 13. Sky perspective, however, remains perfectly simple, so long as it can be reduced to any rectilinear arrangement; but when nearly the whole system is curved, which nine times out of ten is the case, it becomes embarrassing. The central figure in Plate 65 represents the simplest possible combination of perspective of straight lines with that of curves, a group of concentric circles of small clouds being supposed to cast shadows from the sun near the horizon. Such shadows are often cast in misty air; the aspect of rays about the sun being, in fact, only caused by spaces between them. They are carried out formally and far in the Plate, to show how curiously they may modify the arrangement of light in a sky. The woodcut, Fig. 83, gives roughly the arrangement of the clouds in Turner's *Pool of Solomon*,¹ in which he has employed a concentric system of circles of this kind, and thus lighted. In the perspective figure the clouds are represented as small square masses, for the sake of greater simplicity, and are so beaded or strung as it were on the curves in

¹ [For this drawing (formerly in Ruskin's collection and presented by him to Cambridge), see Vol. XIII. pp. 447, 558; and compare Vol. III. p. 383.]

66 Light in the West, Beauvais

which they move, as to keep their distances precisely equal, and their sides parallel. This is the usual condition of cloud: for though arranged in curved ranks, each cloud has its face to the front, or, at all events, acts in some parallel

Fig. 83

line—generally another curve—with those next to it: being rarely, except in the form of fine radiating striæ, arranged on the curves as at *a*, Fig. 84; but as at *b*, or *c*. It would make the diagram too complex if I gave one of

Fig. 84

intersecting curves; but the lowest figure in Plate 65 represents, in perspective, two groups of ellipses arranged in equidistant straight and parallel lines, and following each other on two circular curves. Their exact relative position is shown in Fig. 2, Plate 56 [p. 83]. While the uppermost

figure in Plate 65 represents, in parallel perspective, a series of ellipses arranged in radiation on a circle, their exact relative size and position are shown in Fig. 3, Plate 56, and the lines of such a sky as would be produced by them, roughly, in Fig. 90, page 170.*

§ 14. And in these figures, which, if we look up the subject rightly, would be but the first and simplest of the series necessary to illustrate the action of the upper cirri, the reader may see, at once, how necessarily painters, untrained in observance of proportion, and ignorant of perspective, must lose in every touch the expression of buoyancy and space in sky. The absolute forms of each cloud are, indeed, not alike, as the ellipses in the engraving; but assuredly, when moving in groups of this kind, there are among them the same proportioned inequalities of relative distance, the same gradated changes from ponderous to elongated form, the same exquisite suggestions of including curve; and a common painter, dotting his clouds down at random, or in more or less equal masses, can no more paint a sky, than he could, by random dashes for its ruined arches, paint the Coliseum.

§ 15. Whatever approximation to the character of upper clouds may have been reached by some of our modern students, it will be found, on careful analysis, that Turner stands more absolutely alone in this gift of cloud-drawing than in any other of his great powers. Observe, I say, cloud-drawing; other great men coloured clouds beautifully; none but he ever drew them truly: this power coming from his constant habit of drawing skies, like everything else, with the pencil point.¹ It is quite impossible to

* I use ellipses in order to make these figures easily intelligible; the curves actually *are* variable curves, of the nature of the cycloid, or other curves of continuous motion; probably produced by a current moving in some such direction as that indicated by the dotted line in Fig. 3, Plate 56.

¹ [For Ruskin's insistence upon this practice of Turner's, see his *Catalogue of the Sketches in the National Gallery*, Vol. XIII. pp. 242 seq.; and compare *Laws of Fesole*, Vol. XV. p. 439.]

Fig. 85

engrave any of his large finished skies on a small scale;¹ but the woodcut, Fig. 85, will give some idea of the forms of cloud involved in one of his small drawings. It is only half of the sky in question, that of Rouen from St. Catherine's Hill, in the Rivers of France.² Its clouds are arranged on two systems of intersecting circles, crossed beneath by long bars very slightly bent. The form of every separate cloud is completely studied; the manner of drawing them will be understood better by help of the Plate opposite, which is a piece of the sky above the "Campo Santo,"* at Venice, exhibited in 1842. It is exquisite in rounding of the separate fragments and buoyancy of the rising central group, as well as in its expression of the wayward influence of curved lines of breeze on a generally rectilinear system of cloud.

§ 16. To follow the subject farther would, however, lead us into doctrine of circular storms, and all kinds of pleasant, but infinite, difficulty, from which temptation I keep clear, believing that enough is now stated to enable the reader to understand what he is to look for in 'Turner's skies; and what kind of power, thought, and science are involved continually in the little white or purple dashes of cloud-spray, which, in such pictures as the San Benedetto, looking to Fusina, the Napoleon, or the Temeraire,³ guide the eye to the horizon more by their true perspective than by their

* Now in the possession of E. Bicknell, Esq., who kindly lent me the picture, that I might make this drawing from it carefully.⁴

¹ [On this matter, compare the Preface, § 6; above, p. 8.]

² [For this drawing (also formerly in Ruskin's collection), see Vol. XIII. pp. 273, 449, 451, 534; and compare Vol. III. p. 338.]

³ [For the "San Benedetto, looking to Fusina" (No. 534 in the National Gallery), see Vol. III. p. 251 n., and Vol. XIII. p. 164 and n. For "the Napoleon"—i.e., "The Exile and the Rock Limpet" (No. 529 in the National Gallery), see Vol. III. pp. 273, 297, 364, 422, 474; Vol. VI. p. 381; Vol. XIII. p. 160; and in this volume, pp. 435 n., 438 n. For "the Temeraire" (No. 524 in the National Gallery), see Vol. XIII. p. 167, and the other passages there referred to in a note.]

⁴ [For this picture, which Ruskin elsewhere calls "Murano and Cemetery," compare Vol. III. p. 251 n. For Mr. Bicknell, see *ibid.*, p. 244 n.]

aerial tone, and are buoyant, not so much by expression of lightness as of motion.*

§ 17. I say the "white or purple" cloud-spray. One word yet may be permitted me respecting the mystery of that colour. What should we have thought—if we had lived in a country where there were no clouds, but only low mist or fog—of any stranger who had told us that, in his country, these mists rose into the air and became purple, crimson, scarlet, and gold? I am aware of no sufficient explanation of these hues of the upper clouds, nor of their strange mingling of opacity with a power of absorbing light. All clouds are so opaque that, however delicate they may be, you never see one through another. Six feet depth of them, at a little distance, will wholly veil the darkest mountain edge; so that, whether for light or shade, they tell upon the sky as body colour on canvas; they have always a perfect surface and bloom;—delicate as a rose-leaf, when required of them, but never poor or meagre in hue, like old-fashioned water-colours. And, if needed, in mass, they will bear themselves for solid force of hue against any rock. Facing p. 441, I have engraved a memorandum made of a clear sunset after rain, from the top of Milan Cathedral.¹ The greater part of the outline is granite²—Monte Rosa—the rest cloud: but it and the granite were dark alike. Frequently, in effects of this kind, the cloud

* I cannot yet engrave these; but the little study of a single rank of cirrus, the lowest in Plate 63, may serve to show the value of perspective in expressing buoyancy. It is not, however, though beautifully engraved by Mr. Armytage, as delicate as it should be, in the finer threads which indicate increasing distance at the extremity. Compare the rising of the lines of curve at the edges of this mass, with the similar action on a larger scale, of Turner's cloud, facing p. 157.

¹ [In the proof for *Cæli Enarrant* Ruskin adds in a footnote:—

"Exquisitely engraved by Mr. Armytage."

Ruskin's original drawing of this subject—on a leaf of a sketch-book—was shown at the Ruskin Exhibition in Manchester, 1904: No. 218, "Sunset from Milan, July 18th, 1846." Compare the closing words in the Preface to the second edition of *Sesame and Lilies* (Vol. XVIII.)]

² [Here, again, in the proof Ruskin adds a footnote:—

"Snow, I should have said,—but rock and snow are alike, seen against the twilight, and far away."]

is darker of the two.* And this opacity is, nevertheless, obtained without destroying the gift they have of letting broken light through them, so that, between us and the sun, they may become golden fleeces, and float as fields of light.¹

Now their distant colours depend on these two properties together; partly on the opacity, which enables them to reflect light strongly; partly on a sponge-like power of gathering light into their bodies.

§ 18. Long ago it was noted by Aristotle, and again by Leonardo,² that vaporous bodies looked russet, or even red, when warm light was seen through them, and blue, when deep shade was seen through them. Both colours may, generally, be seen on any wreath of cottage smoke.

Whereon, easy conclusion has been sometimes founded by modern reasoners. All red in sky is caused by light seen through vapour, and all blue by shade seen through vapour.

* In the Autobiography of John Newton³ there is an interesting account of the deception of a whole ship's company by cloud, taking the aspect and outline of mountainous land. They ate the last provision in the ship, so sure were they of its being land, and were nearly starved to death in consequence.

¹ [Here, as the following passage in the MS. shows, Ruskin had intended to introduce another plate:—

“There is much mystery in the way they do this—as indeed in all they do. Opposite, for instance, is a note of an opening one evening on Lago Maggiore after storm. The Simplon snows are in the distance: between them and us, low down, float fragments of unlighted clouds. Their light must be wholly by transparency, for all are far above the eye, and the position of the mountain shows they are lighted from above. And yet the clouds which enclose the opening are dark. Though in substance apparently as dense as the rest, it is not easy to conceive each of the luminous clouds as a thin horizontal film. This, however, is possible; how far, we shall see presently, when we come to cloud perspective: all that we have to note here is the capacity which, at some given thickness, cloud possesses of becoming wholly luminous.”]

² [See Leonardo's *Treatise on Painting*, § 233 in Bohn's translation: “This is observed in the smoke coming out of a chimney, which, when passing through the black soot, appears bluish, but as it ascends against the blue of the sky, it changes its appearance into a reddish brown.” Aristotle notices similar phenomena in his *De Coloribus*, ch. iii.]

³ [*The Life of John Newton, formerly Rector of St. Mary Woolnoth, with Selections from his Correspondence*, ch. iii. pp. 43–44 (ed. 1855). For another reference to Newton, see Vol. XII. p. 571.]

Easy, indeed, but not sure, even in cloud-colour only. It is true that the smoke of a town may be of a rich brick red against golden twilight; and of a very lovely, though not bright, blue against shade. But I never saw crimson or scarlet smoke, nor ultramarine smoke.

Even granting that watery vapour in its purity may give the colours more clearly, the red colours are by no means always relieved against light. The finest scarlets are constantly seen in broken flakes on a deep purple ground of heavier cloud beyond, and some of the loveliest rose-colours on clouds in the east, opposite the sunset, or in the west in the morning. Nor are blues always attainable by throwing vapour over shade. Especially, you cannot get them by putting it over blue itself. A thin vapour on dark blue sky is of a warm gray, not blue. A thunder-cloud, deep enough to conceal everything behind it, is often dark lead colour, or sulphurous blue; but the thin vapours crossing it, milky white. The vividest hues are connected also with another attribute of clouds, their lustre—metallic in effect, watery in reality. They not only reflect colour as dust or wool would, but, when far off, as water would; sometimes even giving a distinct image of the sun underneath the orb itself; in all cases becoming dazzling in lustre, when at a low angle, capable of strong reflection. Practically, this low angle is only obtained when the cloud seems near the sun, and hence we get into the careless habit of looking at the golden reflected light, as if it were actually caused by nearness to the fiery ball.

§ 19. Without, however, troubling ourselves at all about laws, or causes of colour, the visible consequences of their operation are notably these—that when near us, clouds present only subdued and uncertain colours; but when far from us, and struck by the sun on their under surfaces—so that the greater part of the light they receive is reflected—they may become golden, purple, scarlet, and intense fiery white, mingled in all kinds of gradations, such as I tried to describe in the chapter on the upper clouds in the first

volume, in hope of being able to return to them “when we knew what was beautiful.”¹

The question before us now is, therefore, What value ought this attribute of clouds to possess in the human mind? Ought we to admire their colours, or despise them? Is it well to watch them as Turner does, and strive to paint them through all deficiency and darkness of inadequate material? Or, is it wiser and nobler—like Claude, Salvator, Ruysdael, Wouvermans—never to look for them—never to pourtray? We must yet have patience a little before deciding this, because we have to ascertain some facts respecting the typical meaning of colour itself; which reserving for another place,² let us proceed here to learn the forms of the inferior clouds, the next range in level below these.

¹ [See Vol. III. p. 369.]

² [See below, pp. 412 *seq.*]

CHAPTER III

THE CLOUD-CHARIOTS

§ 1. BETWEEN the flocks of small countless clouds which occupy the highest heavens, and the gray undivided film of the true rain-cloud, form the fixed masses or torn fleeces, sometimes collected and calm, sometimes fiercely drifting, which are, nevertheless, known under one general name of cumulus, or heaped cloud.

The true cumulus, the most majestic of clouds, and almost the only one which attracts the notice of ordinary observers, is for the most part windless; the movements of its masses being solemn, continuous, inexplicable, a steady advance or retiring, as if they were animated by an inner will, or compelled by an unseen power. They appear to be peculiarly connected with heat, forming perfectly only in the afternoon, and melting away in the evening. Their noblest conditions are strongly electric, and connect themselves with storm-cloud and true thunder-cloud. When there is thunder in the air, they will form in cold weather, or early in the day.

§ 2. I have never succeeded in drawing a cumulus. Its divisions of surface are grotesque and endless, as those of a mountain; perfectly defined, brilliant beyond all power of colour, and transitory as a dream. Even Turner never attempted to paint them, any more than he did the snows of the high Alps.¹

Nor can I explain them any more than I can draw them. The ordinary account given of their structure is, I believe, that the moisture raised from the earth by the sun's heat

¹ [Compare Vol. XIII. p. 509, where it is said that Turner knew "he might as well have set himself to paint opals or rubies" as the upper snows.]

becomes visible by condensation at a certain height in the colder air, that the level of the condensing point is that of the cloud's base, and that above it, the heaps are pushed up higher and higher as more vapour accumulates, till, towards evening, the supply beneath ceases; and at sunset, the fall of dew enables the surrounding atmosphere to absorb and melt them away. Very plausible. But it seems to me herein unexplained how the vapour is held together in those heaps. If the clear air about and above it has no aqueous vapour in it, or at least a much less quantity, why does not the clear air keep pulling the cloud to pieces, eating it away, as steam is consumed in open air? Or, if any cause prevents such rapid devouring of it, why does not the aqueous vapour diffuse itself softly in the air like smoke, so that one would not know where the cloud ended? What should make it bind itself in those solid mounds, and stay so:—positive, fantastic, defiant, determined?

§ 3. If ever I am able to understand the process of the cumulus formation,* it will become to me one of the most interesting of all subjects of study to trace the connection of the threatening and terrible outlines of thunder-cloud with the increased action of the electric power. I am for the present utterly unable to speak respecting this matter, and must pass it by, in all humility, to say what little I have ascertained respecting the more broken and rapidly moving forms of the central clouds, which connect themselves with mountains, and may, therefore, among mountains, be seen close and truly.

§ 4. Yet even of these, I can only reason with great doubt and continual pause. This last volume ought certainly to be better than the first of the series, for two reasons. I have learned during the sixteen years to say little where I said much, and to see difficulties where I

* One of the great difficulties in doing this is to distinguish the portions of cloud outline which really slope upwards from those which only appear to do so, being in reality horizontal, and thrown into apparent inclination by perspective.

continually with the return current to the upper edge of the mountain, where it is caught by the straight wind and partly torn, partly melted away in broken fragments. In Fig. 86 the dark mass represents the mountain peak, the arrow the main direction of the wind, the curved lines show the directions of such current and its concentration, and the

Fig. 86

dotted line encloses the space in which cloud forms densely, floating away beyond and above in irregular tongues and flakes. The third figure from the top in Plate 69 represents the actual aspect of it when in full develop-

ment, with a strong south wind, in a clear day, on the Aiguille Dru, the sky being perfectly blue and lovely around.¹

So far all is satisfactory. But the true helmet cloud will not allow itself to be thus explained away. The uppermost figure in Plate 69 represents the loveliest form of it, seen in that perfect arch, so far as I know, only over the highest piece of earth in Europe.

§ 6. Respecting which there are two mysteries:—First, why it should form only at a certain distance above the snow, showing blue sky between it and the summit. Secondly, why, so forming, it should always show as an arch, not as a concave cup. This last question puzzles me especially. For, if it be a true arch, and not a cup, it ought to show itself in certain positions of the spectator, or directions of the wind, like the ring of Saturn, as a mere line, or as a spot of cloud pausing over the hill-top. But I never saw it so. While, as above noticed, the lowest form of the helmet cloud is not white as of silver, but like Dolon's

¹ [Ruskin remarks in *The Storm-Cloud* that this formation of the "lee-side cloud" was afterwards represented by Tyndall under the title of "Banner-Cloud"; see the frontispiece and §§ 84, 227 in Tyndall's *The Forms of Water in Clouds and Rivers, Ice and Glaciers* (first published in 1872).]

1. Ruskin

2. The village
1871. 1872. 1873.

helmet of wolf-skin,¹—it is a gray, flaky veil, lapping itself over the shoulders of a more or less conical peak; and of this, also, I have no word to utter but the old one, “Electricity,” and I might as well say nothing.

§ 7. Neither the helmet cloud, nor the lee-side cloud, however, though most interesting and beautiful, is of much importance in picturesque effect. They are too isolated and strange. But the great mountain cloud, which seems to be a blending of the two with independent forms of vapour (that is to say, a greater development, in consequence of the mountain’s action, of clouds which would in some way or other have formed anywhere), requires prolonged attention, as the principal element of the sky in noblest landscape.

§ 8. For which purpose, first, it may be well to clear a few clouds out of the way. I believe the true cumulus is never seen in a great mountain region, at least never associated with hills. It is always broken up and modified by them. Boiling and rounded masses of vapour occur continually, as behind the Aiguille Dru (lowest figure in Plate 69); but the quiet, thoroughly defined, infinitely divided and modelled pyramid never develops itself. It would be very grand if one ever saw a great mountain peak breaking through the domed shoulders of a true cumulus; but this I have never seen.

§ 9. Again, the true high cirri never cross a mountain in Europe. How often have I hoped to see an Alp rising through and above their level-laid and rippled fields! but those white harvest-fields are heaven’s own. And, finally, even the low, level cirrus (used so largely in Martin’s pictures²) rarely crosses a mountain. If it does, it usually becomes slightly waved or broken, so as to destroy its character. Sometimes, however, at great distances, a very

¹ [See Euripides, *Rhesus*, 208 seq. (λύκειον ἀμφὶ νῶτον ἄψομαι δορὰν), and *Iliad*, 10, 334 :—

ἔσσαντο δ’ ἔκτοσθεν ῥῶν πολιοῖο λύκοιο,
κρατὶ δ’ ἐπὶ κτιδέην κυνέην :

“and put on thereover the skin of a grey wolf, and on his head a helm of weasel.”]

² [For other references to Martin, see Vol. III. pp. 3 n., 5, 29, 36, 389; Vol. IV. pp. 311, 366; Vol. XII. pp. 125, 223.]

level bar of cloud will strike across a peak; but nearer, too much of the under surface of the field is seen, so that a well-defined bar across a peak seen at a high angle, is of the greatest rarity.

§ 10. The ordinary mountain cloud, therefore, if well defined, divides itself into two kinds: a broken condition of cumulus, grand in proportion as it is solid and quiet,—and a strange modification of drift-cloud, midway, as I said, between the helmet and the lee-side forms. The broken, quiet cumulus impressed Turner exceedingly when he first saw it on hills. He uses it, slightly exaggerating its definiteness, in all his early studies among the mountains of the Chartreuse,¹ and very beautifully in the vignette of St. Maurice in Rogers's *Italy*. There is nothing, however, to be specially observed of it, as it only differs from the cumulus of the plains, by being smaller and more broken.

§ 11. Not so the mountain drift-cloud, which is as peculiar as it is majestic. The Plates 70 and 71 show, as well as I can express, two successive phases of it on a mountain crest;² (in this instance the great limestone ridge above St. Michel, in Savoy³). But what colossal proportions this noble cloud assumes may be best gathered from the rude sketch, Fig. 87, in which I have simply put firm black ink over the actual pencil-lines made at the moment, giving the form of a single wreath of the drift-cloud, stretching about five miles in a direct line from the summit of one of the Alps of the Val d'Aosta, as seen from the plain of Turin. It has a grand volcanic look, but I believe its aspect of rising from the peak to be almost, if not altogether, deceptive; and that the apparently gigantic column is a nearly horizontal stream of lee-side cloud, tapered into the distance by perspective, and thus rising at its apparently lowest, but

¹ [Several of these are in the National Gallery: see Vol. XIII. p. 375. For the "St. Maurice," see Vol. XIII. p. 616, and the other passages there noted.]

² [For the meaning of the title of Plate 70, "The Graïæ," see below, ch. iv. § 10 (p. 182); for "Venga Medusa" (Plate 71), see Vol. V. p. 285, and below, p. 184. For a further reference to both Plates, see below, ch. iv. § 17 (p. 188).]

³ [Ruskin was at St. Michel (now a station on the Mont Cenis railway, between St. Jean de Maurienne and Modane) in 1858: see above, Introduction, p. xlvii.]

71 "Venga Medusa"

in reality most distant point, from the mountain summit whose shade calls it into being out of the clear winds.

Whether this be so or not, the apparent origin of the cloud on the peak, and radiation from it, distinguish it from the drift-cloud of level country, which arranges itself at the horizon in broken masses, such as Fig. 89, showing no point of origin; and I do not know how far they are vertical cliffs or horizontally extended fields. They are apt to be very precipitous in aspect, breaking into fragments with an apparently concentric motion, as in the figure; but of this motion also—whether vertical or horizontal—I can say nothing positive.

§ 12. The absolute scale of such clouds may be seen, or at least demonstrated, more clearly in Fig. 88, which is a rough note of an effect of sky behind the tower of Berne Cathedral. It was made from the mound beside the railroad bridge. The Cathedral tower is half-a-mile distant. The great Eiger of Grindelwald is seen just on the right of it. This mountain is distant from the tower thirty-four miles as the crow flies, and ten thousand feet above it in height. The drift-cloud behind it, therefore, being in full light, and showing no overhanging surfaces, must rise at least twenty thousand feet into the air.

§ 13. The extreme whiteness of the volume of vapour in this case (not, I fear, very intelligible in the woodcut*) may be partly owing to recent rain, which, by its evaporation, gives a peculiar density and brightness to some forms of clearing cloud. In order to understand this, we must

* I could not properly illustrate the subject of clouds without numbers of these rude drawings, which would probably offend the general reader by their coarseness, while the cost of engraving them in facsimile is considerable, and would much add to the price of the book. If I find people at all interested in the subject, I may, perhaps, some day systematize and publish my studies of cloud separately.¹ I am sorry not to have given in this volume a careful study of a rich cirrus sky, but no wood-engraving that I can employ on this scale will express the finer threads and waves.

¹ [This idea was not carried out. *Cæli Enarrant*, if continued, might have done it, as Ruskin intended to supplement that work by an "atlas" of plates (see above, p. 145 n.).]

consider another set of facts. When weather is thoroughly wet among hills, we ought no more to accuse the mountains of forming the clouds, than we do the plains in similar circumstances. 'The unbroken mist buries the mountains to their bases; but that is not their fault. It may be just as wet and just as cloudy elsewhere. (This is not true of Scottish mountain, by the way.) But when the wet weather is breaking, and the clouds pass, perhaps, in great measure, away from the plains, leaving large spaces of blue sky, the mountains begin to shape clouds for themselves. The fallen moisture evaporates from the plain invisibly; but not so from the hill-side. There, what quantity of rain has not gone down in the torrents, ascends again to heaven instantly in white clouds. The storm passes as if it had tormented the crags, and the strong mountains smoke like tired horses.

§ 14. Here is another question for us of some interest. Why does the much greater quantity of moisture lying on the horizontal fields send up no visible vapour, and the less quantity left on the rocks glorify itself into a magnificent wreath of soaring snow?

First, for the very reason that it is less in quantity, and more distributed; as a wet cloth smokes when you put it near the fire, but a basin of water not.

The previous heat of the crags, noticed in the first volume, p. 249,¹ is only a part of the cause. It operates only locally, and on remains of sudden showers. But after any number of days and nights of rain, and in all places exposed to returning sunshine and breezes, the *distribution* of the moisture tells. So soon as the rain has ceased, all water that can run off is of course gone from the steep hill-sides; there remains only the thin adherent film of moisture to be dried; but that film is spread over a complex texture—all manner of crannies, and bosses, and projections, and filaments of moss and lichen, exposing a vast

¹ [Ruskin's reference was to the first edition; see now Vol. III. p. 402.]

Fig. 85

Fig. 89

extent of drying surface to the air. And the evaporation is rapid in proportion.

§ 15. Its rapidity, however, observe, does not account for its visibility, and this is one of the questions I cannot clearly solve, unless I were sure of the nature of the vesicular vapour. When our breath becomes visible on a frosty day, it is easily enough understood that the moisture which was invisible, carried by the warm air from the lungs, becomes visible when condensed or precipitated by the surrounding chill; but one does not see why air passing over a moist surface quite as cold as itself should take up one particle of water more than it can conveniently—that is to say, invisibly—carry. Whenever you *see* vapour, you may not inaccurately consider the air as having got more than it can properly hold, and dropping some. Now it is easily understood how it should take up much in the lungs, and let some of it fall when it is pinched by the frost outside; but why should it overload itself there on the hills, when it is at perfect liberty to fly away as soon as it likes, and come back for more? I do not see my way well in this. I do not see it clearly, even through the wet cloth. I shall leave all the embarrassment of the matter, however, to my reader, contenting myself, as usual, with the actual fact, that the hill-side air does behave in this covetous and unreasonable manner; and that, in consequence, when the weather is breaking (and sometimes, provokingly, when it is not), phantom clouds form and rise in sudden crowds of wild and spectral imagery along all the far succession of the hill slopes and ravines.

§ 16. There is this distinction, however, between the clouds that form during the rain and after it. In the worst weather, the rain-cloud keeps rather high, and is unbroken; but when there is a disposition in the rain to relax, every now and then a sudden company of white clouds will form quite low down (in Chamouni or Grindelwald, and such high districts, even down to the bottom of the valley),

which will remain, perhaps, for ten minutes, filling all the air, then disappear as suddenly as they came, leaving the gray upper cloud and steady rain to their work. These "clouds of relaxation," if we may so call them, are usually flaky and horizontal, sometimes tending to the silky cirrus, yet showing no fine forms of drift; but when the rain has passed, and the air is getting warm, forms the true clearing cloud, in wreaths that ascend continually, with a slow circling motion, melting as they rise. The woodcut, Fig. 91, is a rude note of it floating more quietly from the hill of the Superga, the church (nearly as large as St. Paul's) appearing above, and thus showing the scale of the wreath.

§ 17. This cloud of evaporation, however, does not always rise. It sometimes rests in absolute stillness, low laid in the hollows of the hills, their peaks emergent from it. Fig. 92 shows this condition of it, seen from a distance, among the Cenis hills.¹ I do not know what gives it this disposition to rest in the ravines, nor whether there is a greater chill in the hollows, or a real action of gravity on the particles of cloud. In general, the position seems to depend on the temperature. Thus, in Chamouni, the crests of La Côte and Taconay continually appear in stormy weather as in Plate 36, Vol. IV.,² in which I intended to represent rising drift-cloud, made dense between the crests by the chill from the glaciers. But in the condition shown in Fig. 92, on a comparatively open sweep of hillside, the thermometer would certainly indicate a higher temperature in the sheltered valley than on the exposed peaks; yet the cloud still subsides into the valleys like folds of a garment; and, more than this, sometimes conditions of morning cloud, dependent, I believe, chiefly on dew evaporation, form first on the *tops* of the soft hills of wooded Switzerland, and droop down in rent fringes, and separate tongues, clinging close to all the hill-sides, and giving them exactly the

¹ [From a note in the MS. it seems that this sketch was made in the "Cenis Valley near S. Ambrogio, below Susa."]

² [See in this edition, Vol. VI. p. 260.]

appearance of being covered with white fringed cloth, falling over them in torn or divided folds. It always looks like a true action of gravity. How far it is, in reality, the indication of the power of the rising sun causing evaporation, first on the hill-top, and then in separate streams, by its divided light on the ravines, I cannot tell. The subject is, as the reader perceives, always inextricably complicated by these three necessities—that to get a cloud in any given

Fig. 92

spot, you must have moisture to form the material of it, heat to develop it, and cold* to show it; and the adverse causes inducing the moisture, the evaporation, and the visibility are continually interchanged in presence and in power. And thus, also, the phenomena which properly belong to

* We might say light, as well as cold; for it wholly depends on the degree of light in the sky how far delicate cloud is seen.

The second figure from the top in Plate 69 shows an effect of morning light on the range of the Aiguille Bouchard (Chamouni). Every crag casts its shadow up into apparently clear sky. The shadow is, in such cases, a bluish gray, the colour of clear sky; and the defining light is caused by the sunbeams showing mist which otherwise would have been unperceived. The shadows are not irregular enough in outline—the sketch was made for their colour and sharpness, not their shape,—and I cannot now put them right, so I leave them as they were drawn at the moment.

a certain elevation are confused, among hills at least, with those which in plains would have been lower or higher.

I have been led unavoidably in this chapter to speak of some conditions of the rain-cloud; nor can we finally understand the forms even of the cumulus, without considering those into which it descends or diffuses itself. Which, however, being, I think, a little more interesting than our work hitherto, we will leave this chapter to its dulness, and begin another.

CHAPTER IV

THE ANGEL OF THE SEA

§ 1. PERHAPS the best and truest piece of work done in the first volume of this book, was the account given in it of the rain-cloud;¹ to which I have here little, descriptively, to add. But the question before us now is, not who has drawn the rain-cloud best, but if it were worth drawing at all. Our English artists naturally painted it often and rightly; but are their pictures the better for it? We have seen how mountains are beautiful; how trees are beautiful; how sun-lighted clouds are beautiful; but can rain be beautiful?

I spoke roughly of the Italian painters in that chapter,² because they could only draw distinct clouds, or violent storms, "massive concretions," while our northern painters could represent every phase of mist and fall of shower.

But is this indeed so delightful? Is English wet weather, indeed, one of the things which we should desire to see Art give perpetuity to?

Yes, assuredly. I have given some reasons for this answer in the fifth chapter of last volume;³ one or two, yet unnoticed, belong to the present division of our subject.

§ 2. The climates or lands into which our globe is divided may, with respect to their fitness for Art, be perhaps conveniently ranged under five heads:—

1. Forest-lands, sustaining the great mass of the magnificent vegetation of the tropics, for the most part characterized by moist and unhealthy heat, and watered by

¹ [See in this edition Vol. III. pp. 393–419.]

² [Or rather of the painters, French or Italian, who painted the Roman Campagna; it is to Gaspar Poussin's storms that the phrase "massive concretions" is applied: see Vol. III. p. 396.]

³ [See Vol. VI. pp. 88, 89.]

enormous rivers, or periodical rains. This country cannot, I believe, develop the mind or art of man. He may reach great subtlety of intellect, as the Indian, but not become learned, nor produce any noble art, only a savage or grotesque form of it.¹ Even supposing the evil influences of climate could be vanquished, the scenery is on too large a scale. It would be difficult to conceive of groves less fit for academic purposes than those mentioned by Humboldt, into which no one can enter except under a stout wooden shield, to avoid the chance of being killed by the fall of a nut.²

2. Sand-lands, including the desert and dry rock-plains of the earth, inhabited generally by a nomad population, capable of high mental cultivation and of solemn monumental or religious art, but not of art in which pleasure-ableness forms a large element, their life being essentially one of hardship.

3. Grape and wheat lands, namely, rocks and hills, such as are good for the vine, associated with arable ground, forming the noblest and best ground given to man. In these districts only art of the highest kind seems possible, the religious art of the sand-lands being here joined with that of pleasure or sense.

4. Meadow-lands, including the great pastoral and agricultural districts of the north, capable only of an inferior art: apt to lose its spirituality and become wholly material.

5. Moss-lands, including the rude forest and mountain

¹ [Compare *Two Paths*, §§ 3 seq. (Vol. XVI. pp. 261 seq.), where Ruskin speaks of the artistic temper of Scotland and of India, corresponding to the "moss" and "forest lands" here.]

² [This is stated by Humboldt in his account of almendron, or *juvia*. The great *drupe*, like a cocoa-nut, which contains the almond, is as large as the human head: "The weight of these fruits is so enormous that the savages dare not enter the forests without covering their heads and shoulders with a buckler of very hard wood. These bucklers are unknown to the natives of Esmeralda, but they told us of the danger incurred when the fruit ripens and falls from a height of fifty or sixty feet" (ch. xxiv. of the *Personal Narrative of Travels to the Equinoctial Regions of America during the years 1799-1804*. By Alexander von Humboldt and Aimé Boupland. Translated by Thomasina Ross. Bohn's edition, 1852, vol. ii. p. 460.)]

ground of the North, inhabited by a healthy race, capable of high mental cultivation and moral energy, but wholly incapable of art, except savage, like that of the forest-lands, or as in Scandinavia.

We might carry out these divisions into others, but these are, I think, essential, and easily remembered in a tabular form; saying "wood" instead of "forest," and "field" for "meadow," we can get such a form shortly worded:—

Wood-lands	...	Shrewd intellect	...	No Art.
Sand-lands	...	High intellect	...	Religious Art.
Vine-lands	...	Highest intellect	...	Perfect Art.
Field-lands	...	High intellect	...	Material Art.
Moss-lands	...	Shrewd intellect	...	No Art.

§ 3. In this table the moss-lands appear symmetrically opposed to the wood-lands, which in a sort they are; the too diminutive vegetation under bleakest heaven, opposed to the too colossal under sultriest heaven, while the perfect ministry of the elements, represented by bread and wine, produces the perfect soul of man.

But this is not altogether so. The moss-lands have one great advantage over the forest-lands, namely, sight of the sky.

And not only sight of it, but continual and beneficent help from it. What they have to separate them from barren rock, namely, their moss and streams, being dependent on its direct help, not on great rivers coming from distant mountain chains, nor on vast tracts of ocean-mist, coming up at evening, but on the continual play and change of sun and cloud.

§ 4. Note this word "change." The moss-lands have an infinite advantage, not only in sight,¹ but in liberty; they are the freest ground in all the world. You can only traverse the great woods by crawling like a lizard, or

¹ [So in all editions; but the MS. reads "light."]

climbing like a monkey—the great sands with slow steps and veiled head. But bare-headed, and open-eyed, and free-limbed, commanding all the horizon's space of changeful light, and all the horizon's compass of tossing ground, you traverse the moss-land. In discipline it is severe as the desert, but it is a discipline compelling to action; and the moss-lands seem, therefore, the rough schools of the world, in which its strongest human frames are knit and tried, and so sent down, like the northern winds, to brace and brighten the languor into which the repose of more favoured districts may degenerate.

§ 5. It would be strange, indeed, if there were no beauty in the phenomena by which this great renovating and purifying work is done. And it is done almost entirely by the great Angel of the Sea—rain;—the Angel, observe, the messenger sent to a special place on a special errand. Not the diffused perpetual presence of the burden of mist, but the going and returning of intermittent cloud. All turns upon that intermittence. Soft moss on stone and rock;—cave fern of tangled glen;—wayside well—perennial, patient, silent, clear; stealing through its square font of rough-hewn stone; ever thus deep, no more; which the winter wreck sullies not, the summer thirst wastes not, incapable of stain as of decline;—where the fallen leaf floats undecayed, and the insect darts undefiling: cressed brook and ever-eddying river, lifted even in flood scarcely over its stepping-stones,—but through all sweet summer keeping tremulous music with harp-strings of dark water among the silver fingering of the pebbles. Far away in the south the strong river Gods have all hasted, and gone down to the sea. Wasted and burning, white furnaces of blasting sand, their broad beds lie ghastly and bare; but here in the moss-lands, the soft wings of the Sea Angel droop still with dew, and the shadows of their plumes falter on the hills: strange laughings and glitterings of silver streamlets, born suddenly, and twined about the

mossy heights in trickling tinsel, answering to them as they wave.*

§ 6. Nor are those wings colourless. We habitually think of the rain-cloud only as dark and gray; not knowing that we owe to it perhaps the fairest, though not the most dazzling of the hues of heaven.¹ Often in our English mornings, the rain-clouds in the dawn form soft, level fields, which melt imperceptibly into the blue; or, when of less extent, gather into apparent bars, crossing the sheets of broader cloud above; and all these bathed throughout in an unspeakable light of pure rose-colour, and purple, and amber, and blue; not shining, but misty-soft; the barred masses, when seen nearer, composed of clusters or tresses of cloud, like floss silk; looking as if each knot were a little swathe or sheaf of lighted rain. No clouds form such skies, none are so tender, various, inimitable. Turner himself never caught them. Correggio, putting out his whole strength, could have painted them, no other man.†

§ 7. For these are the robes of love of the Angel of the

* Compare the beautiful stanza beginning the epilogue of the *Golden Legend*.²

† I do not mean that Correggio is greater than Turner, but that only *his* way of work, the touch which he has used for the golden hair of Antiope,³ for instance, could have painted these clouds. In open lowland country I have never been able to come to any satisfactory conclusion about their height, so strangely do they blend with each other. Here, for instance, is the arrangement of an actual group of them. The space at A was deep, purest ultramarine blue, traversed by streaks of absolutely pure and perfect rose-colour. The blue passed downwards imperceptibly into gray at G, and then into amber, and at the white edge below into gold. On this amber ground the streaks

¹ [Compare *The Storm-Cloud of the Nineteenth Century*, note 2.]

² ["God sent his messenger, the rain,
And said unto the mountain brook,
'Rise up, and from thy caverns look
And leap, with naked, snow-white feet,
From the cool hills into the heat
Of the broad, arid plain.'"]

For other references to the *Golden Legend* of Longfellow, see Vol. V. pp. 1vii., 229, 430; Vol. VI. pp. 394, 446; and Vol. XII. pp. 487-488.]

³ [For other references to this picture, see above, p. 53 n.]

Sea. To these that name is chiefly given, the "spreadings of the clouds,"¹ from their extent, their gentleness, their fulness of rain. Note how they are spoken of in Job, xxxvi. 31-33.² "By them judgeth He the people; He giveth meat in abundance. With clouds He covereth the light.* He hath hidden the light in His hands, and commanded it that

P were dark purple, and, finally, the spaces at B B, again clearest and most precious blue, paler than that at A. The *two* levels of these clouds are always very notable. After a continuance of fine weather among the Alps, the determined approach of rain is usually announced by a soft, unbroken film of level cloud, white and thin at the approaching edge, gray at the horizon, covering the whole sky from side to side, and advancing steadily from the south-west.

Fig. 93

Under its gray veil, as it approaches, are formed detached bars, darker or lighter than the field above, according to the position of the sun. These bars are usually of a very sharply elongated oval shape, something like fish. I habitually call them "fish-clouds," and look upon them with much discomfort, if any excursions of interest have been planned within the next three days. Their oval shape is a perspective deception dependent on their flatness; they are probably thin, extended fields, irregularly circular.

* I do not copy the interpolated words which follow, "and commandeth it *not to shine*." The closing verse of the chapter, as we have it, is unintelligible; not so in the Vulgate, the reading of which I give.³

¹ [Job xxxvi. 29.]

² [These verses came to have a special significance to Ruskin: see *Laws of Fésale* (Vol. XV. p. 417 n.).]

³ [In the English version: "The noise thereof sheweth concerning it, the cattle also concerning the vapour"; made clearer in the Revised version: "The noise thereof telleth concerning him, The cattle also concerning the storm that cometh up." In the Vulgate: "Annunciat de ea amico suo quod possessio ejus sit et ad eam possit ascendere."]

it should return. He speaks of it to His friend; that it is his possession, and that he may ascend thereto."

That, then, is the Sea Angel's message to God's friends; *that*, the meaning of those strange golden lights and purple flushes before the morning rain. The rain is sent to judge, and feed us; but the light is the possession of the friends of God, and they may ascend thereto,—where the tabernacle veil will cross and part its rays no more.

§ 8. But the Angel of the Sea has also another message,—in the "great rain of his strength,"¹ rain of trial, sweeping away ill-set foundations. Then his robe is not spread softly over the whole heaven, as a veil, but sweeps back from his shoulders, ponderous, oblique, terrible—leaving his sword-arm free.

The approach of trial-storm, hurricane-storm, is indeed in its vastness as the clouds of the softer rain. But it is not slow nor horizontal, but swift and steep: swift with passion of ravenous winds; steep as slope of some dark, hollowed hill. The fronting clouds come leaning forward, one thrusting the other aside, or on; impatient, ponderous, impendent, like globes of rock tossed of Titans—Ossa on Olympus—but hurled forward all, in one wave of cloud-lava—cloud whose throat is as a sepulchre. Fierce behind them rages the oblique wrath of the rain, white as ashes, dense as showers of driven steel; the pillars of it full of ghastly life; Rain-Furies, shrieking as they fly;—scourging, as with whips of scorpions;—the earth ringing and trembling under them, heaven wailing wildly, the trees stooped blindly down, covering their faces, quivering in every leaf with horror, ruin of their branches flying by them like black stubble.

§ 9. I wrote Furies. I ought to have written Gorgons. Perhaps the reader does not know that the Gorgons are not dead, are ever undying. We shall have to take our chance of being turned into stones by looking them in the face, presently. Meantime, I gather what part of the great Greek story of the Sea Angels has meaning for us here.

¹ [Job xxxvii. 6.]

Nereus,¹ the God of the Sea, who dwells in it always (Neptune being the God who rules it from Olympus), has children by the Earth; namely, Thaumas, the father of Iris; that is, the "wonderful" or miracle-working angel of the sea; Phorcys, the malignant angel of it (you will find him degraded through many forms, at last, in the story of Sinbad, into the old man of the sea); Ceto, the deep places of the sea, meaning its bays among rocks, therefore called by Hesiod "Fair-cheeked" Ceto; and Eurybia, the tidal force or sway of the sea, of whom more hereafter.²

§ 10. Phorcys and Ceto, the malignant angel of the sea and the spirit of its deep rocky places, have children, namely, first, Graiæ, the soft rain-clouds. The Greeks had a greater dislike of storm than we have, and therefore whatever violence is in the action of rain, they represented by harsher types than we should—types given in one group by Aristophanes (speaking in mockery of the poets): "This was the reason, then, that they made so much talk about the fierce rushing of the moist clouds, coiled in glittering; and the locks of the hundred-headed Typhon; and the blowing storms: and the bent-clawed birds drifted on the breeze, fresh, and aerial."³ Note the expression "bent-clawed birds."⁴ It illustrates two characters of these clouds; partly their coiling form; but more directly the way they tear down the earth from the hill-sides; especially those twisted storm-clouds which in violent action become the waterspout. These always strike at a narrow point, often opening the earth on a hill-side into a trench as a great pickaxe would

¹ [Here Ruskin does not quite follow Hesiod, who makes Thaumas, like Nereus, the child of Pontus (*Theogony*, 237). Thaumas in turn weds Electra (lustre), and from their union springs Iris (the rainbow). For Phorcys, see also the *Odyssey*, xiii. 96, where he is called "the ancient one of the sea." For Ceto (καλλιπάρηον) and Eurybia, see *Theogony*, 238, 239; which continues (270 *seq.*): "Next to Phorcys, fair-cheeked Ceto bare the Graiæ, gray from their birth, whom in truth immortal gods as well as men walking on the earth call Graiæ; namely, Pephredo the well-robed, and Enyo the crocus-robed, and the Gorgons who dwell beyond famous Ocean, in the most remote quarter night-ward, where are the clear-voiced Hesperides, Stheno, Euryale, and Medusa."]

² [See below, pp. 396, 397.]

³ [*Clouds*, 335-337.]

⁴ [γαμψοὺς οἰωνοὺς.]

(whence the Graiæ are said to have only one beak between them¹). Nevertheless, the rain-cloud was, on the whole, looked upon by the Greeks as beneficent, so that it is boasted of in the Œdipus Coloneus for its perpetual feeding of the springs of Cephissus,* and elsewhere often; and the opening song of the rain-clouds in Aristophanes is entirely beautiful:²—

“O eternal Clouds! let us raise into open sight our dewy existence, from the deep-sounding Sea, our Father, up to the crests of the wooded hills, whence we look down over the sacred land, nourishing its fruits, and over the rippling of the divine rivers, and over the low murmuring bays of the deep.’ I cannot satisfy myself about the meaning of the names of the Graiæ—Pephredo and Enuo³—but the epithets which Hesiod gives them are interesting; “Pephredo, the well-robed; Enuo, the crocus-robed;” probably, it seems to me, from their beautiful colours in morning.

§ 11. Next to the Graiæ, Phoreys and Ceto begat the Gorgons, which are the true storm-clouds.⁴ The Graiæ have only one beak or tooth, but all the Gorgons have tusks like boars; brazen hands (brass being the word used for the

* I assume the αὔπνοι κρῆναι νομάδες to mean clouds, not springs; but this does not matter, the whole passage being one of rejoicing in moisture and dew of heaven.⁵

¹ [See below, § 11.]

² [The chorus in the *Clouds*, lines 275–284.]

³ [Probably derived from φράζω (ἡ πεφραδοῦσα), she who gives counsel—possibly the cloud that gives warning; but one MS. reads Τεφρηδῶ, “ashy.” “The meaning of ἐννόλιος, as of the evidently cognate Ἐννώ, is quite unknown, and is probably not Greek (? Thracian)” (Leaf on *Iliad*, xvii. 211); Enuo was also the name of the sister of Mars, so that it might here be interpreted as the “war-cloud.” The reading of the line in Hesiod is considered doubtful, for Æschylus (*Prom.*, 814) says that the Graiæ were three, and only two are here mentioned, and Apollodorus (ii. 4) gives the name of the third as Δεινώ.]

⁴ [So in *Ethics of the Dust*, § 112, Ruskin says of the Queen of the Air that “the Greek, in a climate of alternate storm and calm, represented the wild fringes of the storm-cloud by the serpents of her ægis; and the lightning and cold of the high-thunder-clouds, by the Gorgon on her shield.” See also *Queen of the Air*, § 94.]

⁵ [See lines 685–687. Ruskin refers to another passage in the same chorus in *Modern Painters*, vol. iii. ch. xiv. § 45 (Vol. V. p. 282). For “elsewhere often,” see, among numerous passages, *Odyssey*, ix. 111; xiii. 245.]

metal of which the Greeks made their spears), and golden wings.¹

Their names are "Steino" (straitened), of storms compressed into narrow compass; "Euryale" (having wide threshing-floor), of storms spread over great space; "Medusa" (the dominant), the most terrible. She is essentially the highest storm-cloud; therefore the hail-cloud or cloud of cold, her countenance turning all who behold it to stone. ("He casteth forth His ice like morsels. Who can stand before His cold?"²) The serpents about her head are the fringes of the hail, the idea of coldness being connected by the Greeks with the bite of the serpent, as with the hemlock.

§ 12. On Minerva's shield, her head signifies, I believe, the cloudy coldness of knowledge, and its venomous character ("Knowledge puffeth up," compare Bacon in *Advancement of Learning*³). But the idea of serpents rose essentially from the change of form in the cloud as it broke; the cumulus cloud not breaking into full storm till it is cloven by the cirrus; which is twice hinted at in the story of Perseus; only we must go back a little to gather it together.⁴

¹ [For this description of the Graiæ, see Æschylus, *Prometheus Vincitus*, 795-796: κούρων ὄμμ' ἐκρημέναι, μονόδοντες. For the boar's tusks of the Gorgons (as always shown in early Greek art), their brazen hands and golden wings, see Apollodorus, *Biblioth.*, ii. 2.]

² [Psalms cxlvii. 17.]

³ [1 Corinthians viii. 1. For the reference to Bacon, see the note on *Stones of Venice*, vol. iii. ch. ii. § 30 (Vol. XI. p. 67), where Ruskin similarly brings together the two passages.]

⁴ [Here in the margin of his own copy Ruskin afterwards wrote: "See Perseus in my own Myth Book," referring to the *Queen of the Air*, § 30, where he says that the birth of Perseus connects the legends of the Danaïdes "with that of the Gorgons and the Graiæ, who are the true clouds of thunderous and ruinous tempest." He there notes further that "the form of the sword or sickle of Perseus, with which he kills Medusa, is another image of the whirling harpy vortex." Compare also *Verona and its Rivers*, § 31, where Ruskin says of Lombardy that "every drift of rain that swells the mountain torrents, if it were caught where it falls, is more truly rain of gold than fell in the tower of Danaë." For the explanation of the sieves of the Danaïdes, as referring to the discovery of the wells at Argos, see Strabo, viii. p. 371 (Casaubon's ed.); there is a verse, says Strabo, about it: "Ἀργος ἀνυδρον ἐὼν Δανααὶ θέσαν Ἄργος ἔνυδρον. For their bringing the mysteries of Ceres from Egypt, see Herodotus, ii. 171: "And of the mystic rites of Demeter . . . I shall leave unspeaken all except so much as piety permits me to tell. The daughters of Danaüs were they who brought this rite out of Egypt and taught it to the women of the Pelasgians." The names Danaüs and Danaë are commonly derived from δαρός

Perseus was the son of Jupiter by Danaë, who being shut in a brazen tower, Jupiter came to her in a shower of gold: the brazen tower being, I think, only another expression for the cumulus or Medusa cloud; and the golden rain for the rays of the sun striking it; but we have not only this rain of Danaë's to remember in connection with the Gorgon, but that also of the sieves of the Danaïdes, said to represent the provision of Argos with water by their father Danaüs, who dug wells about the Acropolis; nor only wells, but opened, I doubt not, channels of irrigation for the fields, because the Danaïdes are said to have brought the mysteries of Ceres from Egypt. And though I cannot trace the root of the names Danaüs and Danaë, there is assuredly some farther link of connection in the deaths of the lovers of the Danaïdes, whom they slew, as Perseus Medusa. And again note, that when the father of Danaë, Acrisius, is detained in Seriphos by storms, a disk thrown by Perseus is carried *by the wind against his head*, and kills him; and lastly, when Perseus cuts off the head of Medusa, from her blood springs Chrysaor, "wielder of the golden sword," the Angel of the Lightning, and Pegasus, the Angel of the "Wild Fountains," that is to say, the fastest flying or lower rain-cloud; winged, but racing as upon the earth.

§ 13. I say, "wild" fountains; because the kind of fountain from which Pegasus is named is especially the "fountain of the great deep"¹ of Genesis; sudden and furious, (cataracts of heaven, not windows, in the Septuagint);—the

(burnt, parched)—Danaë thus being supposed to be the dry earth, whose fructification is expressed in the fable of Zeus and Danaë. For the deaths of the lovers of the Danaïdes, see, among other places, Æschylus, *Prom. Vinc.*, 853–861, and Horace, *Odes*, iii. 11. For the story of Acrisius, see Hyginus, *Fab.* 63: "Qui (Acrisius) cum tempestate retineretur, Polydectes moritur. Cui cum funebres ludos facerent, Perseus disco misso, quem ventus distulit in caput Acrisii, eum interfecit." Then we resume the *Theogony* (280–283): "From her too (Medusa), when, as the tale is, Perseus had cut off the head, up sprang huge Chrysaor and the steed Pegasus. Thus called, because he was born near the springs (πηγαί) of ocean; whilst the other had a golden sword in his hands."

¹ [Genesis vii. 11: "The same day were all the fountains of the great deep broken up, and the windows of heaven were broken." In the Septuagint: ἐρράγησαν πᾶσαι αἱ πηγαὶ τῆς ἀβύσσου καὶ οἱ καταράβηται τοῦ οὐρανοῦ ἠνεψύθησαν.]

mountain torrent caused by thunderous storm, or as our "fountain"—a Geyser-like leaping forth of water. Therefore, it is the deep and full source of streams, and so used typically of the source of evils, or of passions;¹ whereas the word "spring" with the Greeks is like our "well-head"—a gentle issuing forth of water continually. But, because both the lightning-fire and the gushing forth, as of a fountain, are the signs of the poet's true power, together with perpetuity, it is Pegasus who strikes the earth with his foot, on Helicon,* and causes Hippocrene to spring forth²—"the horse's well-head." It is perpetual; but has, nevertheless, the Pegasean storm-power.

§ 14. Wherein we may find, I think, sufficient cause for putting honour upon the rain-cloud. Few of us, perhaps, have thought, in watching its career across our own mossy hills, or listening to the murmur of the springs amidst the mountain quietness, that the chief masters of the human imagination owed, and confessed that they owed, the force of their noblest thoughts, not to the flowers of the valley, nor the majesty of the hill, but to the flying cloud.

Yet they never saw it fly, as we may in our own England. So far, at least, as I know the clouds of the south, they are often more terrible than ours, but the English Pegasus is swifter. On the Yorkshire and Derbyshire hills, when the rain-cloud is low and much broken, and the steady west wind fills all space with its strength,†

* I believe, however, that when Pegasus strikes forth this fountain, he is to be regarded, not as springing from Medusa's blood, but as born of Medusa by Neptune; the true horse was given by Neptune striking the earth with his trident; the divine horse is born to Neptune and the storm-cloud.

† I have been often at great heights on the Alps in rough weather, and have seen strong gusts of storm in the plains of the south. But, to get full expression of the very heart and the meaning of wind, there is no place like a Yorkshire moor. I think Scottish breezes are thinner, very bleak and piercing, but not substantial. If you lean on them they will let you fall,

¹ [For *πηγαὶ ποταμῶν*, the gushing water of rivers, see *Iliad*, xx. 9, etc.; and for *πηγὴ κακῶν*, *Æsch. Persæ*, 743, etc.]

² [For this legend, see *Pausanias*, ix. 31, 3.]

the sun-gleams fly like golden vultures: they are flashes rather than shinings; the dark spaces and the dazzling race and skim along the acclivities, and dart and dip from crag to dell, swallow-like;¹—no Graiæ these, —gray and withered: Grey Hounds rather, following the Cerinthian² stag with the golden antlers.

§ 15. There is one character about these lower rain-clouds, partly affecting all their connection with the upper sky, which I have never been able to account for; that which, as before noticed, Aristophanes fastened on at once for their distinctive character—their obliquity.³ They always fly in an oblique position, as in the Plate opposite, which is a careful facsimile of the first advancing mass of the rain-cloud in 'Turner's Slave Ship.' When the head of the cloud is foremost, as in this instance, and rain falling beneath, it is easy to imagine that its drops, increasing in size as they fall, may exercise some retarding action on the wind. But the head of the cloud is not always first, the base of it is sometimes advanced.* The only certainty is, that it will not shape itself horizontally, its thin-drawn lines and main contours will always be oblique, though its motion is horizontal; and, which is still more curious, their sloping lines

but one may rest against a Yorkshire breeze as one would on a quick-set hedge. I shall not soon forget,—having had the good fortune to meet a vigorous one on an April morning, between Hawes and Settle, just on the flat under Whernside,—the vague sense of wonder with which I watched Ingleborough stand without rocking.⁵

* When there is a violent current of wind near the ground, the rain columns slope *forward* at the foot. See the Entrance to Fowey Harbour, of the England Series.⁶

¹ [With this passage and the author's footnote to it, compare *The Storm-Cloud of the Nineteenth Century*, Lecture ii., where Ruskin quotes them; remarking of the note that it is "a precious little piece, not of word-painting, but of simply told feeling," and illustrating the similitude—"swallow-like"—by further observations.]

² [A slip of the pen, the reference being to the Ceryneian stag with the golden antlers, pursued by Hercules (Apollodorus, 2, 5, 3).]

³ [See *Modern Painters*, vol. i. (Vol. III. p. 26).]

⁴ [For this picture, see in Vol. III. Plate 12 and pp. 571 *seq.*]

⁵ [The exact date was March 7, 1859. See the letter given above, Introduction, p. xlix., where Ruskin says it seemed as if the wind "would blow Ingleborough into Lancaster Bay."]

⁶ [For other references to this drawing, see Vol. III. p. 421.]

are hardly ever modified in their descent by any distinct retiring tendency or perspective convergence. A troop of leaning clouds will follow one another, each stooping forward at the same apparent slope, round a fourth of the horizon.

§ 16. Another circumstance which the reader should note in this cloud of Turner's, is the witch-like look of drifted or erected locks of hair at its left side. We have just read the words of the old Greek poet, "Locks of the hundred-headed Typhon";¹ and must remember that Turner's account of this picture, in the Academy catalogue, was "Slavers throwing overboard the Dead and Dying. *Typhoon* coming on." The resemblance to wildly drifted hair is stronger in the picture than in the engraving; the gray and purple tints of torn cloud being relieved against golden sky beyond.

§ 17. It was not, however, as we saw, merely to locks of hair, but to serpents, that the Greeks likened the dissolving of the Medusa cloud in blood. Of that sanguine rain, or of its meaning, I cannot yet speak. It is connected with other and higher types, which must be traced in another place.*

But the likeness to serpents we may illustrate here. The two Plates already given, 70 and 71 (at page 168), represent successive conditions of the Medusa cloud on one of the Cenis hills (the great limestone precipice above St. Michel, between Lanslebourg and St. Jean de Maurienne).† In the first, the cloud is approaching, with the lee-side cloud forming beyond it; in the second, it has approached, increased, and broken, the Medusa serpents writhing about the central peak, the rounded tops of the broken cumulus showing above. In this instance, they take nearly the forms of

* See Part IX. chap. 2, "The Hesperid Æglé."

† The reader must remember that sketches made as these are, on the instant, cannot be far carried, and would lose all their use, if they were finished at home. These were both made in pencil, and merely washed with gray on returning to the inn, enough to secure the main forms.

¹ [Above, § 10, p. 182.]

flame; but when the storm is more violent, they are torn into fragments, and magnificent revolving wheels of vapour are formed, broken, and tossed into the air, as the grass is tossed in the hayfield from the toothed wheels of the raking-machine;¹ (perhaps, in common with all other inventions of the kind, likely to bring more evil upon men than ever the Medusa cloud did, and turn them more effectually into stone.*)

§ 18. I have named in the first volume the principal works of Turner representing these clouds;² and until I am able to draw them better, it is useless to say more of them; but in connection with the subject we have been examining, I should be glad if the reader could turn to the engravings of the England drawings of Salisbury and Stonehenge. What opportunities Turner had of acquainting himself with classical literature, and how he used them, we shall see presently.³ In the meantime, let me simply assure the reader that, in various byways, he had gained a knowledge of most of the great Greek traditions, and that he felt them more than he knew them; his mind being affected, up to a certain point, precisely as an ancient painter's would have been, by external phenomena of nature. To him, as to the Greek, the storm-clouds seemed messengers of fate. He feared them, while he revered; nor does he ever introduce them without some hidden purpose, bearing upon the expression of the scene he is painting.

* I do not say this carelessly, nor because machines throw the labouring man "out of work." The labouring man will always have more work than he wants. I speak thus because the use of such machinery involves the destruction of all pleasures in rural labour;⁴ and I doubt not, in that destruction, the essential deterioration of the national mind.

¹ [In eds. 1 and 1873, "mowing-machine"; altered in 1888 to "raking" in accordance with Ruskin's corrected copy. Such machines were introduced from America in 1858 and 1859.]

² [See again Vol. III. pp. 393-419. The "Stonehenge" is there described, p. 413. For the "Salisbury," see Vol. XIII. pp. 441, 593.]

³ [Below, pt. ix. ch. x., pp. 392 *seq.*]

⁴ [On this subject, compare *Time and Tide*, § 152; *Lectures on Art*, § 116; and *Fors Clavigera*, Letters 45 and 67.]

§ 19. On that plain of Salisbury, he had been struck first by its widely-spacious pastoral life; and secondly, by its monuments of the two great religions of England—Druidical and Christian.

He was not a man to miss the possible connection of these impressions. He treats the shepherd life as a type of the ecclesiastical; and composes his two drawings so as to illustrate both.

In the drawing of Salisbury, the plain is swept by rapid but not distressful rain. The cathedral occupies the centre of the picture, towering high over the city, of which the houses (made on purpose smaller than they really are) are scattered about it like a flock of sheep. The cathedral is surrounded by a great light. The storm gives way at first in a subdued gleam over a distant parish church, then bursts down again, breaks away into full light about the cathedral, and passes over the city, in various sun and shade. In the foreground stands a shepherd leaning on his staff, watching his flock;—bareheaded: he has given his cloak to a group of children, who have covered themselves up with it, and are shrinking from the rain; his dog crouches under a bank; his sheep, for the most part, are resting quietly, some coming up the slope of the bank towards him.*

§ 20. The rain-clouds in this picture are wrought with a care which I have never seen equalled in any other sky of the same kind. It is the rain of blessing—abundant, but full of brightness; golden gleams are flying across the wet grass, and fall softly on the lines of willows in the valley—willows by the watercourses; the little brooks flash out here and there between them and the fields. Turn now to the Stonehenge. That, also, stands in great light; but it is the Gorgon light—the sword of Chrysaor is bared against it. The cloud of judgment hangs above. The rock

* You may see the arrangement of subject in the published engraving, but nothing more; it is among the worst engravings in the England Series.¹

¹ [It was engraved by W. Radclyffe.]

pillars seem to reel before its slope, pale beneath the lightning. And nearer, in the darkness, the shepherd lies dead, his flock scattered.

I alluded, in speaking before of this Stonehenge,¹ to Turner's use of the same symbol in the drawing of Pæstum for Rogers's *Italy*; but a more striking instance of its employment occurs in a Study of Pæstum, which he engraved himself before undertaking the *Liber Studiorum*, and another in his drawing of the Temple of Minerva, on Cape Colonna; and observe farther that he rarely introduces lightning, if the ruined building has not been devoted to religion. The wrath of man may destroy the fortress, but only the wrath of heaven can destroy the temple.

§ 21. Of these secret meanings of Turner's, we shall see enough in the course of the inquiry we have to undertake, lastly, respecting ideas of relation;² but one more instance of his opposed use of the lightning symbol, and of the rain of blessing, I name here, to confirm what has been noted above. For, in this last instance, he was questioned respecting his meaning, and explained it.³ I refer to the drawings of Sinai and Lebanon, made for Finden's Bible. The sketches from which Turner prepared that series were, I believe, careful and accurate; but the treatment of the

¹ [See Vol. III. p. 414, where there is an incidental reference to the Pæstum, but the symbol—the shepherd—is not mentioned. The "Study of Pæstum" is one of the eleven small unpublished Plates, engraved in pure mezzotint, which are sometimes called "Sequel to *Liber Studiorum*." The drawing of Cape Colonna was engraved in vol. i. of the 1825 edition of Byron's *Works*.]

² [See especially pp. 393, 402, 407, 435.]

³ [Ruskin had this information from his friend (and Turner's), the Rev. William Kingsley (for whom, see Vol. XIII. p. 162 n.). Mr. Kingsley (in a letter preserved at Brantwood) thus describes the conversation: "On one occasion I had with me the Bible drawings, and asked him if he would like to see them. He declined, and said he had seen too much of them. He then told me that the publishers thought he was mad, and required him to put nothing into the drawings beyond what might actually be there; that he had in his hand the sketch of Rachel's Tomb, and asked whether he might put wolves into it. He said to me, 'Perhaps you have found wolves in others.' He also said he had leave to do what he liked with the encampment in Sinai, and that he made it and the Lebanon to represent the Law and the Gospel." Turner's drawing of Lebanon (made from a sketch by C. Barry) was given by Ruskin to Oxford (see Vol. XIII. pp. 447, 560); that of Sinai was from a sketch by Gally Knight.]

subjects was left wholly to him. He took the Sinai and Lebanon to show the opposite influences of the Law and the Gospel. The rock of Moses is shown in the burning of the desert, among fallen stones, forked lightning cleaving the blue mist which veils the summit of Sinai. Armed Arabs pause at the foot of the rock. No human habitation is seen, nor any herb or tree, nor any brook, and the lightning strikes without rain.* Over the Mount Lebanon an intensely soft gray-blue sky is melting into dewy rain. Every ravine is filled, every promontory crowned, by tenderest foliage, golden in slanting sunshine.† The white convent nestles into the hollow of the rock; and a little brook runs under the shadow of the nearer trees, beside which two monks sit reading.

§ 22. It was a beautiful thought, yet an erring one, as all thoughts are which oppose the Law to the Gospel. When people read, "The law came by Moses, but grace and truth by Christ,"¹ do they suppose it means that the law was ungracious and untrue? The law was given for a foundation; the grace (or mercy) and truth for fulfilment; —the whole forming one glorious Trinity of judgment, mercy, and truth.² And if people would but read the text of their Bibles with heartier purpose of understanding it, instead of superstitiously, they would see that throughout the parts, which they are intended to make most personally their own (the Psalms), it is always the Law which is spoken of with chief joy. The Psalms respecting mercy are often sorrowful, as in thought of what it cost; but those

* Hosea xiii. 5 and 15.

† Hosea xiv. 4, 5, 6. Compare Psalm lxxii. 6–16.

¹ [See John i. 17.]

² [The passage from here from "When people read" to the end of § 22 is § 76 in *Frondees Agrestes* (1875), where at this point Ruskin added the following footnote:—

"A great deal of the presumption and narrowness caused by my having been bred in the Evangelical school, and which here fill me with shame and distress in re-reading *Modern Painters*, is, to my present mind, atoned for by the accurate thinking by which I broke my way through to the great truth expressed in this passage, which all my later writings, without exception, have been directed to maintain and illustrate."]

respecting the law are always full of delight. David cannot contain himself for joy in thinking of it,—he is never weary of its praise:—"How love I thy law! it is my meditation all the day. Thy testimonies are my delight and my counsellors; sweeter, also, than honey and the honeycomb."¹

§ 23. And I desire, especially, that the reader should note this, in now closing the work through which we have passed together in the investigation of the beauty of the visible world. For perhaps he expected more pleasure and freedom in that work; he thought that it would lead him at once into fields of fond imagination, and may have been surprised to find that the following of beauty brought him always under a sterner dominion of mysterious law; that brightness was continually based upon obedience, and all majesty only another form of submission. But this is indeed so. I have been perpetually hindered in this inquiry into the sources of beauty by fear of wearying the reader with their severities. It was always accuracy I had to ask of him, not sympathy; patience, not zeal; apprehension, not sensation. The thing to be shown him was not a pleasure to be snatched, but a law to be learned.

§ 24. It is in this character, however, that the beauty of the natural world completes its message. We saw long ago, how its various *powers* of appeal to the mind of men might be traced to some typical expression of Divine attributes.² We have seen since how its *modes* of appeal present constant types of human obedience to the Divine law, and constant proofs that this law, instead of being contrary to mercy, is the foundation of all delight, and the guide of all fair and fortunate existence.

§ 25. Which understanding, let us receive our last message from the Angel of the Sea.

Take up the 19th Psalm and look at it verse by verse. Perhaps to my younger readers, one word may be

¹ [Psalms cxix. 97; xix. 10.]

² [See *Modern Painters*, vol. ii. chs. v.-xi., "Of Typical Beauty" (Vol. IV. pp. 76-145).]

permitted respecting their Bible-reading in general.* The Bible is, indeed, a deep book, when depth is required, that is to say, for deep people. But it is not intended, particularly, for profound persons; on the contrary, much more for shallow and simple persons. And therefore the first, and generally the main and leading idea of the Bible, is on its surface, written in plainest possible Greek, Hebrew, or English, needing no penetration, nor amplification, needing nothing but what we all might give—attention.

But this, which is in every one's power, and is the only thing that God wants, is just the last thing any one will give Him. We are delighted to ramble away into day-dreams, to repeat pet verses from other places, suggested by chance words; to snap at an expression which suits our own particular views, or to dig up a meaning from under a verse, which we should be amiably grieved to think any human being had been so happy as to find before. But the plain, intended, immediate, fruitful meaning, which every one ought to find always, and especially that which depends on our seeing the relation of the verse to those near it, and getting the force of the whole passage, in due relation—this sort of significance we do not look for; it being, truly, not to be discovered, unless we really attend to what is said, instead of to our own feelings.

§ 26. It is unfortunate, also, but very certain, that in order to attend to what is said, we must go through the irksomeness of knowing the meaning of the words. And

* I believe few sermons are more false or dangerous than those in which the teacher proposes to impress his audience by showing "how much there is in a verse." If he examined his own heart closely before beginning, he would often find that his real desire was to show how much he, the expounder, could make out of the verse. But entirely honest and earnest men often fall into the same error. They have been taught that they should always look deep, and that Scripture is full of hidden meanings; and they easily yield to the flattering conviction that every chance idea which comes into their heads in looking at a word, is put there by Divine agency. Hence they wander away into what they believe to be an inspired meditation, but which is, in reality, a meaningless jumble of ideas; perhaps, very proper ideas, but with which the text in question has nothing whatever to do.

the first thing that children should be taught about their Bibles is, to distinguish clearly between words that they understand and words that they do not; and to put aside the words they do not understand, and verses connected with them, to be asked about, or for a future time; and never to think they are reading the Bible when they are merely repeating phrases of an unknown tongue.

§ 27. Let us try, by way of example, this 19th Psalm, and see what plain meaning is uppermost in it.

“The heavens declare the glory of God.”¹

What are the heavens?

The word occurring in the Lord's Prayer, and the thing expressed being what a child may, with some advantage, be led to look at, it might be supposed among a school-master's first duties to explain this word clearly.

Now there can be no question that in the minds of the sacred writers, it stood naturally for the entire system of cloud, and of space beyond it, conceived by them as a vault set with stars. But there can, also, be no question, as we saw in previous inquiry,² that the firmament, which is said to have been “called” heaven, at the creation, expresses, in all definite use of the word, the system of clouds, as spreading the power of the water over the earth; hence the constant expressions dew of heaven, rain of heaven, etc., where heaven is used in the singular; while “the heavens,” when used plurally, and especially when in distinction, as here, from the word “firmament,” remained expressive of the starry space beyond.

§ 28. A child might therefore be told (surely, with advantage), that our beautiful word Heaven may possibly have been formed from a Hebrew word, meaning “the high place”; that the great warrior Roman nation, camping much out at night, generally overtired and not in moods

¹ [Taken by Ruskin, as we have seen, as the title of his cloud-studies: *Cæli Enarrant.*]

² [The chapter (vi.) on “The Firmament” in the preceding volume (Vol. V., pp. 106 *seq.*.)]

for thinking, are believed by many people to have seen in the stars only the likeness of the glittering studs of their armour, and to have called the sky "The bossed, or studded"; but that others think those Roman soldiers on their night-watches had rather been impressed by the great emptiness and void of night, and by the far-coming of sounds through its darkness, and had called the heaven, "The Hollow place." Finally, I should tell the children, showing them first the setting of a star, how the great Greeks had found out the truest power of the heavens, and had called them, "The Rolling."¹ But whatever different nations had called them, at least I would make it clear to the child's mind that in this 19th Psalm, their whole power being intended, the two words are used which express it; the Heavens, for the great vault or void, with all its planets, and stars, and ceaseless march of orbs innumerable; and the Firmament, for the ordinance of the clouds.

These heavens, then, "declare the *glory* of God"; that is, the light of God, the eternal glory, stable and changeless. As their orbs fail not—but pursue their course for ever, to give light upon the earth—so God's glory surrounds man for ever—changeless, in its fulness insupportable—infinite.

"And the firmament sheweth His *handywork*."

§ 29. The clouds, prepared by the hands of God for the help of man, varied in their ministration—veiling the inner splendour—show, not His eternal glory, but His daily handiwork. So He dealt with Moses. I will cover thee "with my hand" as I pass by.² Compare Job xxxvi. 24: "Remember that thou magnify His work, which men behold.

¹ [Ruskin here refers not so much to the etymology of the word *οὐρανός* (which appears to be derived from the Sanscrit *varunas*, and to mean the *nightly* firmament), as to the Homeric conception of the heaven as always revolving (*e.g.*, *Iliad*, xviii. 485-489), and to the theory of the Greek philosophers that the universe was a system of revolving *spheres*. So, again, with "Heaven": its ultimate etymological derivation is unknown; but as used in the Bible, it is the translation of Hebrew words meaning *hill* or *high place*. The alternative derivations of the Latin word for *sky*—as the hollow place (hence sometimes spelt *coelum* instead of *cælum*), or studded—are given by Varro, *De Lingua Latina*, v. 18.]

² [Exodus xxxiii. 22.]

Every man may see it." Not so the glory—that only in part; the courses of these stars are to be seen imperfectly, and but by few. But this firmament, "every man may see it, man may behold it afar off." "Behold, God is great, and we know Him not. For He maketh small the drops of water: they pour down rain according to the vapour thereof."

§ 30. "Day unto day uttereth speech, and night unto night sheweth knowledge. They have no speech nor language, yet without these their voice is heard. Their rule is gone out throughout the earth, and their words to the end of the world."

Note that. Their rule throughout the earth, whether inhabited or not—their law of light is thereon; but their words, spoken to human souls, to the end of the inhabited world.

"In them hath He set a tabernacle for the sun," etc. Literally, a tabernacle, or curtained tent, with its veil and its hangings; also of the colours of His desert tabernacle—blue, and purple, and scarlet.

Thus far the psalm describes the manner of this great heaven's message.

Thenceforward it comes to the matter of it.

§ 31. Observe, you have the two divisions of the declaration. The heavens (compare Psalm viii.) declare the eternal glory of God before men, and the firmament the daily mercy of God towards men. And the eternal glory is in this—that the law of the Lord is perfect, and His testimony sure, and His statutes right.

And the daily mercy in this—that the commandment of the Lord is pure, and His fear is clean, and His judgments true and righteous.

There are three oppositions:—

Between law and commandment.

Between testimony and fear.

Between statute and judgment.

§ 32. I. Between law and commandment.

The law is fixed and everlasting; uttered once, abiding for ever, as the sun, it may not be moved. It is "perfect, converting the soul": the whole question about the soul being, whether it has been turned from darkness to light, acknowledged this law or not,—whether it is godly or ungodly? But the commandment is given momentarily to each man, according to the need. It does not convert: it guides. It does not concern the entire purpose of the soul: but it enlightens the eyes, respecting a special act. The law is, "Do this always"; the commandment, "Do *thou* this *now*": often mysterious enough, and through the cloud; chilling, and with strange rain of tears; yet always pure (the law converting, but the commandment cleansing): a rod not for guiding merely, but for strengthening, and tasting honey with. "Look how mine eyes have been enlightened, because I tasted a little of this honey."¹

§ 33. II. Between testimony and fear.

The testimony is everlasting: the true promise of salvation. Bright as the sun beyond all the earth-cloud, it makes wise the simple; all wisdom being assured in perceiving it and trusting it; all wisdom brought to nothing which does not perceive it.

But the fear of God is taught through special encouragement and special withdrawal of it, according to each man's need—by the earth-cloud—smile and frown alternately: it also, as the commandment, is clean, purging, and casting out all other fear, it only remaining for ever.

§ 34. III. Between statute and judgment.

The statutes are the appointments of the Eternal justice; fixed and bright, and constant as the stars; equal and balanced as their courses. They "are right, rejoicing the heart." But the judgments are special judgments of given acts of men. "True," that is to say, fulfilling the warning or promise given to each man; "righteous altogether," that is, done or executed in truth and righteousness. The

¹ [1 Samuel xiv. 29.]

statute is right, in appointment. The judgment righteous altogether, in appointment and fulfilment;—yet not always rejoicing the heart.

Then, respecting all these, comes the expression of passionate desire, and of joy; that also divided with respect to each. The glory of God, eternal in the Heavens, is future, “to be *desired* more than gold, than much fine gold”—treasure in the heavens that faileth not. But the present guidance and teaching of God are on earth; they are now possessed, sweeter than all earthly food—“sweeter than honey and the honeycomb. Moreover by them” (the law and the testimony) “is Thy servant warned”—warned of the ways of death and life.

“And in keeping them” (the commandments and the judgments) “there is great reward”: pain now, and bitterness of tears, but reward unspeakable.

§ 35. Thus far the psalm has been descriptive and interpreting. It ends in prayer.

“Who can understand his errors?” (wanderings from the perfect law). “Cleanse Thou me from secret faults”; from all that I have done against Thy will, and far from Thy way, in the darkness. “Keep back Thy servant from presumptuous sins” (sins against the commandment) against Thy will when it is seen and direct, pleading with heart and conscience. “So shall I be undefiled, and innocent from the great transgression”—the transgression that crucifies afresh.

“Let the words of my mouth (for I have set them to declare Thy law), and the meditation of my heart (for I have set it to keep Thy commandments), be acceptable in Thy sight,” whose glory is my strength, and whose work, my redemption; “my Strength, and my Redeemer.”

PART VIII

OF IDEAS OF RELATION:—FIRST, OF
INVENTION FORMAL

Drawn by J.M.W. Turner

Engraved by P. Perrot

8.5 Château de Blois

CHAPTER I

THE LAW OF HELP

§ 1. WE have now reached the last and the most important part of our subject. We have seen in the first division of this book, how far art may be, and has been, consistent with physical or material facts. In its second division, we examined how far it may be and has been obedient to the laws of physical beauty. In this last division we have to consider the relations of art to God and man: its work in the help of human beings, and service of their Creator.¹

We have to inquire into the various Powers, Conditions, and Aims of mind involved in the conception or creation of pictures; in the choice of subject, and the mode and order of its history;—the choice of forms, and the modes of their arrangement.

And these phases of mind being concerned, partly with choice and arrangement of incidents, partly with choice and arrangement of forms and colours, the whole subject will fall into two main divisions, namely, expressional or spiritual invention; and material or formal invention.

They are of course connected;—all good formal invention being expressional also; but as a matter of convenience it is best to say what may be ascertained of the nature of formal invention, before attempting to illustrate the faculty in its higher field.²

¹ [Here Ruskin reverts to the threefold division of his subject given in the first volume (Vol. III. p. 130).]

² [The Plate of the "Château de Blois" (first introduced here in the edition of 1888) is not referred to in this volume; but elsewhere in *Modern Painters* Ruskin notices its merits as a composition. See Vol. III. p. 313, where he instances the torches and white figures, and the roof of the chapel and monks' dresses, as examples of his statement that Turner was true to nature in making his highest lights and deepest darks in exceedingly small quantities; p. 336 *n.*, where it is cited as an instance of

§ 2. First, then, of INVENTION FORMAL, otherwise and most commonly called technical composition; that is to say, the arrangement of lines, forms, or colours, so as to produce the best possible effect.

I have often been accused of slighting this quality in pictures;¹ the fact being that I have avoided it only because I considered it too great and wonderful for me to deal with. The longer I thought, the more wonderful it always seemed: and it is, to myself personally, the quality, above all others, which gives me delight in pictures. Many others I admire, or respect; but this one I rejoice in. Expression, sentiment, truth to nature, are essential: but all these are not enough. I never care to look at a picture again, if it be ill composed; and if well composed I can hardly leave off looking at it.

“Well composed.” Does that mean according to rule?

No. Precisely the contrary. Composed as only the man who did it could have done it; composed as no other picture is, or was, or ever can be again. Every great work stands alone.

§ 3. Yet there are certain elementary laws of arrangement traceable a little way; a few of these only I shall note, not caring to pursue the subject far in this work, so intricate it becomes even in its first elements: nor could it be treated with any approach to completeness, unless I were to give many and elaborate outlines of large pictures. I have a vague hope of entering on such a task, some future day.² Meantime I shall only indicate the place which technical composition* should hold in our scheme.

* The word composition has been so much abused, and is in itself so inexpressive, that when I wrote the first part of this work I intended always

“the mystery of decided line”; p. 340 *n.*, as an instance of the confusion of detail during twilight; and p. 423, where it is catalogued among characteristic examples of effects of light. The drawing (engraved in *Rivers of France*) was in Ruskin's collection, and presented by him to the University Galleries at Oxford (Vol. XIII. p. 560).]

¹ [See Vol. XII. p. 387.]

² [The task was not, however, undertaken; compare Vol. V. p. 9; Vol. VI. p. 4; and above, p. 8.]

And, first, let us understand what composition is, and how far it is required.

§ 4. Composition may be best defined as the help of everything in the picture by everything else.

I wish the reader to dwell a little on this word "Help." It is a grave one.

In substance which we call "inanimate," as of clouds, or stones, their atoms may cohere to each other, or consist with each other, but they do not help each other. The removal of one part does not injure the rest.

But in a plant, the taking away of any one part does injure the rest. Hurt or remove any portion of the sap, bark, or pith, the rest is injured. If any part enters into a state in which it no more assists the rest, and has thus become "helpless," we call it also "dead."

The power which causes the several portions of the plant to help each other, we call life. Much more is this so in an animal. We may take away the branch of a tree without much harm to it; but not the animal's limb. Thus, intensity of life is also intensity of helpfulness—completeness of depending of each part on all the rest. The ceasing of this help is what we call corruption; and in proportion to the perfectness of the help, is the dreadfulness of the loss. The more intense the life has been, the more terrible is its corruption.

The decomposition of a crystal is not necessarily impure

to use, in this final section of it, the word "invention," and to reserve the term "composition" for that false composition which can be taught on principles; as I have already so employed the term in the chapter on "Imagination Associative," in the second volume.¹ But, in arranging this section, I find it is not conveniently possible to avoid the ordinary modes of parlance: I therefore only head the section as I intended (and as is, indeed, best), using in the text the ordinarily accepted term; only the reader must be careful to note that what I spoke of shortly as "composition" in the chapters on "Imagination," I here always call, distinctly, "false composition"; using here, as I find most convenient, the words "invention" or "composition" indifferently, for the true faculty.

¹ [See in this edition, Vol. IV, p. 231.]

at all. The fermentation of a wholesome liquid begins to admit the idea slightly; the decay of leaves yet more; of flowers, more; of animals, with greater painfulness and terribleness in exact proportion to their original vitality; and the foulest of all corruption is that of the body of man; and in his body, that which is occasioned by disease, more than that of natural death.

§ 5. I said just now, that though atoms of inanimate substance could not help each other, they could “consist” with each other. “Consistence” is their virtue. Thus the parts of a crystal are consistent, but of dust, inconsistent. Orderly adherence, the best help its atoms can give, constitutes the nobleness of such substance.

When matter is either consistent, or living, we call it pure, or clean; when inconsistent or corrupting (unhelpful), we call it impure, or unclean. The greatest uncleanness being that which is essentially most opposite to life.

Life and consistency, then, both expressing one character (namely, helpfulness of a higher or lower order), the Maker of all creatures and things, “by whom all creatures live, and all things consist,”¹ is essentially and for ever the Helpful One, or in softer Saxon, the “Holy” One.²

The word has no other ultimate meaning: Helpful, harmless, undefiled: “living” or “Lord of life.”

The idea is clear and mighty in the cherubim’s cry: “Helpful, helpful, helpful, Lord God of Hosts”;³ *i.e.* of all the hosts, armies, and creatures of the earth.*

* “The cries of them which have reaped have entered into the ears of the Lord of Sabaoth (of all the creatures of the earth).”⁴ You will find a wonderful clearness come into many texts by reading, habitually, “helpful” and “helpfulness” for “holy” and “holiness” or else “living,” as in Rom. xi. 16. The sense “dedicated” (the Latin *sanctus*), being, of course, inapplicable to the Supreme Being, is an entirely secondary and accidental one.

¹ [See Colossians i. 16, 17: compare below, p. 482.]

² [On this suggested connexion of “holy” and “helpful,” compare *Munera Pulveris*, Appendix ii.]

³ [From the *Te Deum*, Ruskin translating “Sabaoth” into “Hosts”; see also Revelation iv. 8.]

⁴ [James v. 4.]

§ 6. A pure or holy state of anything, therefore, is that in which all its parts are helpful or consistent. They may or may not be homogeneous. The highest or organic purities are composed of many elements in an entirely helpful state. The highest and first law of the universe—and the other name of life is, therefore, “help.” The other name of death is “separation.” Government and co-operation are in all things and eternally the laws of life. Anarchy and competition, eternally, and in all things, the laws of death.¹

§ 7. Perhaps the best, though the most familiar example we could take of the nature and power of consistence, will be that of the possible changes in the dust we tread on.

Exclusive of animal decay, we can hardly arrive at a more absolute type of impurity than the mud or slime of a damp, over-trodden path, in the outskirts of a manufacturing town. I do not say mud of the road, because that is mixed with animal refuse; but take merely an ounce or two of the blackest slime of a beaten footpath on a rainy day, near a large manufacturing town.

§ 8. That slime we shall find in most cases composed of clay (or brickdust, which is burnt clay) mixed with soot, a little sand, and water. All these elements are at helpless war with each other, and destroy reciprocally each other's nature and power, competing and fighting for place at every tread of your foot;—sand squeezing out clay, and clay squeezing out water, and soot meddling everywhere and defiling the whole. Let us suppose that this ounce of mud is left in perfect rest, and that its elements gather together, like to like, so that their atoms may get into the closest relations possible.

§ 9. Let the clay begin. Ridding itself of all foreign substance, it gradually becomes a white earth,² already very

¹ [In these sentences, said Ruskin (*Unto this Last*, § 54), “my principles of Political Economy were all summed.” See also *Ethics of the Dust*, § 120, where §§ 6–9 here are quoted, and Vol. XVI. p. 486.]

² [Ruskin in his copy for revision refers to a note on the white campanula in his diary for 1861–1863, where he describes how that flower “at first answers partly the purpose of its own calyx, showing itself just a little out of the calyx quite green,” till, “as it expands, it purifies itself to purer white slowly.”]

beautiful; and fit, with help of congealing fire, to be made into finest porcelain, and painted on, and be kept in kings' palaces. But such artificial consistence is not its best. Leave it still quiet to follow its own instinct of unity, and it becomes not only white, but clear; not only clear, but hard; nor only clear and hard, but so set that it can deal with light in a wonderful way, and gather out of it the loveliest blue rays only, refusing the rest. We call it then a sapphire.¹

Such being the consummation of the clay, we give similar permission of quiet to the sand. It also becomes, first, a white earth, then proceeds to grow clear and hard, and at last arranges itself in mysterious, infinitely fine, parallel lines, which have the power of reflecting not merely the blue rays, but the blue, green, purple, and red rays in the greatest beauty in which they can be seen through any hard material whatsoever. We call it then an opal.²

In next order the soot sets to work; it cannot make itself white at first, but instead of being discouraged, tries harder and harder, and comes out clear at last, and the hardest thing in the world; and for the blackness that it had, obtains in exchange the power of reflecting all the rays of the sun at once in the vividest blaze that any solid thing can shoot. We call it then a diamond.

Last of all the water purifies or unites itself, contented enough if it only reach the form of a dew-drop;³ but if we insist on its proceeding to a more perfect consistence, it crystallizes into the shape of a star.

And for the ounce of slime which we had by political economy of competition, we have by political economy of co-operation, a sapphire, an opal, and a diamond, set in the midst of a star of snow.

§ 10. Now invention in art signifies an arrangement, in

¹ [Ruskin takes this illustration of natural beauty more than once: see *Lectures on Architecture and Painting*, § 12 (Vol. XII. p. 29), and *Ethics of the Dust*, § 45.]

² [For other references to the opal, see above, part vi. ch. x. § 1; *Seven Lamps* (Vol. VIII. p. 180); *Lectures on Art*, § 173; and *Fors Clavigera*, Letter 70.]

³ [On the dew-drop and the diamond, compare again *Lectures on Art*, § 173.]

which everything in the work is thus consistent with all things else, and helpful to all else.

It is the greatest and rarest of all the qualities of art. The power by which it is effected is absolutely inexplicable and incommunicable; but exercised with entire facility by those who possess it, in many cases even unconsciously.*

In work which is not composed, there may be many beautiful things, but they do not help each other. They at the best only stand beside, and more usually compete with and destroy, each other. They may be connected artificially in many ways, but the test of there being no invention is, that if one of them be taken away, the others are no worse than before. But in true composition, if one be taken away, all the rest are helpless and valueless. Generally, in falsely composed work, if anything be taken away, the rest will look better; because the attention is less distracted. Hence the pleasure of inferior artists in sketching, and their inability to finish: all that they add destroys.

§ 11. Also in true composition, everything not only helps everything else a *little*, but helps with its utmost power. Every atom is in full energy; and *all* that energy is kind. Not a line, nor spark of colour, but is doing its very best, and that best is aid. The extent to which this law is carried in truly right and noble work is wholly inconceivable to the ordinary observer, and no true account of it would be believed.

§ 12. True composition being entirely easy to the man

* By diligent study of good compositions, it is possible to put work together, so that the parts shall help each other a little, or at all events do no harm; and when some tact and taste are associated with this diligence, semblances of real invention are often produced, which, being the results of great labour, the artist is always proud of; and which, being capable of learned explanation and imitation, the spectator naturally takes interest in. The common precepts about composition all produce and teach this false kind, which, as true composition is the noblest, being the corruption of it, is the ignoblest condition of art.¹

¹ [On the principle of *Corruptio optimi pessima*, compare Vol. V. p. 47.]

who can compose, he is seldom proud of it, though he clearly recognizes it. Also, true composition is inexplicable. No one can explain how the notes of a Mozart melody, of the folds of a piece of Titian's drapery, produce their essential effects on each other.¹ If you do not feel it, no one can by reasoning make you feel it. And the highest composition is so subtle, that it is apt to become unpopular, and sometimes seem insipid.

§ 13. The reader may be surprised at my giving so high a place to invention. But if he ever come to know true invention from false, he will find that it is not only the highest quality of art, but is simply the most wonderful act or power of humanity. It is pre-eminently the deed of human creation; *ποίησις*, otherwise, poetry.

If the reader will look back to my definition of poetry, he will find it is "the suggestion by the imagination of noble grounds for noble emotion" (Vol. III. p. 11),² amplified below (§ 14) into "assembling by help of the imagination"; that is to say, imagination associative, described at length in Vol. II., in the chapter just referred to.³ The mystery of the power is sufficiently set forth in that place. Of its dignity I have a word or two to say here.

§ 14. Men in their several professed employments, looked at broadly, may be properly arranged under five classes:—

1. Persons who see. These in modern language are sometimes called sight-seers, that being an occupation coming more and more into vogue every day. Anciently they used to be called, simply, seers.

2. Persons who talk. These, in modern language, are usually called talkers, or speakers, as in the House of Commons, and elsewhere. They used to be called prophets.

3. Persons who make. These, in modern language, are usually called manufacturers. Anciently they were called poets.

4. Persons who think. There seems to be no very distinct

¹ [Compare *Elements of Drawing*, § 192 (Vol. XV. p. 163), and Vol. V. p. 119.]

² [Ruskin's reference is to the first edition: see here Vol. V. pp. 28, 29.]

³ [In § 3 n.]

modern title for this kind of person, anciently called philosophers, nevertheless we have a few of them among us.

5. Persons who do: in modern language, called practical persons; anciently, believers.

Of the first two classes I have only this to note—that we ought neither to say that a person sees, if he sees falsely, nor speaks, if he speaks falsely. For seeing falsely is worse than blindness, and speaking falsely, than silence. A man who is too dim-sighted to discern the road from the ditch, may feel which is which;—but if the ditch appears manifestly to him to be the road, and the road to be the ditch, what shall become of him? False seeing is unseeing, on the negative side of blindness; and false speaking, unspeaking,—on the negative side of silence.

To the persons who think, also, the same test applies very shrewdly. Theirs is a dangerous profession; and from the time of the Aristophanes thought-shop¹ to the great German establishment, or thought-manufactory, whose productions have, unhappily, taken in part the place of the older and more serviceable commodities of Nuremberg toys and Berlin wool, it has been often harmful enough to mankind. It should not be so, for a false thought is more distinctly and visibly no thought, than a false saying is no saying. But it is touching the two great productive classes of the doers and makers, that we have one or two important points to note here.

§ 15. Has the reader ever considered, carefully, what is the meaning of “doing” a thing?

Suppose a rock falls from a hill-side, crushes a group of cottages, and kills a number of people. The stone has produced a great effect in the world. If any one asks, respecting the broken roofs, “What did it?” you say the stone did it. Yet you don’t talk of the deed of the stone. If you enquire farther, and find that a goat had been feeding beside the rock, and had loosened it by gnawing the

¹ [So (φροντιστήριον) Aristophanes calls the school of Socrates: *Clouds*, 94, 128. For other attacks by Ruskin on German schools of philosophy, see Vol. V. pp. 201–203, 203 n., 424.]

roots of the grasses beneath, you find the goat to be the active cause of the calamity, and you say the goat did it. Yet you don't call the goat the doer, nor talk of its evil deed. But if you find any one went up to the rock, in the night, and with deliberate purpose loosened it, that it might fall on the cottages, you say in quite a different sense, "It is his deed; he is the doer of it."

§ 16. It appears, then, that deliberate purpose and resolve are needed to constitute a deed or doing, in the true sense of the word; and that when, accidentally or mechanically, events take place without such purpose, we have indeed effects or results, and agents or causes, but neither deeds nor doers.

Now it so happens, as we all well know, that by far the largest part of things happening in practical life *are* brought about with no deliberate purpose. There are always a number of people who have the nature of stones; they fall on other persons and crush them. Some again have the nature of weeds, and twist about other people's feet and entangle them. More have the nature of logs, and lie in the way, so that every one falls over them. And most of all have the nature of thorns, and set themselves by waysides, so that every passer-by must be torn, and all good seed choked; or perhaps make wonderful crackling under various pots, even to the extent of practically boiling water and working pistons. All these people produce immense and sorrowful effect in the world. Yet none of them are doers; it is their nature to crush, impede, and prick; but deed is not in them.*

§ 17. And farther, observe, that even when some effect is finally intended, you cannot call it the person's deed, unless it is *what* he intended.

If an ignorant person, purposing evil, accidentally does good, (as if a thief's disturbing a family should lead them

* We may, perhaps, expediently recollect as much of our botany as to teach us that there may be sharp and rough persons, like spines, who yet have good in them, and are essentially branches, and can bud. But

to discover in time that their house was on fire); or, *vice versâ*, if an ignorant person intending good accidentally does evil (as if a child should give hemlock to his companions for celery), in neither case do you call them the doers of what may result. So that in order to a true deed, it is necessary that the effect of it should be foreseen. Which, ultimately, it cannot be, but by a person who knows, and in his deed obeys, the laws of the universe, and of its Maker. And this knowledge is in its highest form, respecting the will of the Ruling Spirit, called Trust. For it is not the knowledge that a thing is, but that, according to the promise and nature of the Ruling Spirit, a thing will be. Also obedience in its highest form is not obedience to a constant and compulsory law, but a persuaded or voluntarily yielded obedience to an issued command: and so far as it was a *persuaded* submission to command, it was anciently called, in a passive sense, "persuasion," or *πίστις*, and in so far as it alone assuredly did, and it alone *could* do, what it meant to do, and was therefore the root and essence of all human deed, it was called by the Latins the "doing," or *fides*, which has passed into the French *foi* and the English *faith*.¹ And therefore because in His doing always certain, and in His speaking always true, His name who leads the armies of Heaven is "Faithful and true,"^{*2} and all deeds which are done in

the true thorny person is no spine, only an excrescence; rootless evermore, leafless evermore. No crown made of such can ever meet glory of Angel's hand. (*In Memoriam*, lxviii.³)

* "True," means, etymologically, not "consistent with fact," but "which may be trusted." "This is a true saying, and worthy of all acceptance,"⁴ etc., meaning a trusty saying,—a saying to be rested on, leant upon.

¹ [Compare below, p. 326; and for some remarks on these suggested etymologies, see above, Introduction, p. lxii.]

² [Revelation xix. 11: see *Munera Pulveris*, § 81 n.]

³ [Ruskin's reference is to the fourth edition of *In Memoriam* (1851), in which edition one additional stanza (lix.) had been introduced. In the edition of 1872 another stanza (xxxix.) was added; so that the stanza here referred to is lix. in the later editions.]

⁴ [1 Timothy i. 15.]

alliance with those armies, be they small or great, are essentially deeds of faith, which therefore, and in this one stern, eternal sense, subdues all kingdoms, and turns to flight the armies of the aliens, and is at once the source and the substance of all human deed, rightly so called.

§ 18. Thus far then of practical persons, once called believers, as set forth in the last word of the noblest group of words ever, so far as I know, uttered by simple man concerning his practice, being the final testimony of the leaders of a great practical nation, whose deed thenceforward became an example of deed to mankind:

᾽Ω ξεῖν', ἀγγέλλειν Λακεδαιμονίοις, ὅτι τῇδε
κείμεθα, τοῖς κείνων ῥήμασι πειθόμενοι.

“O stranger! (we pray thee), tell the Lacedæmonians that we are lying here, having *obeyed* their words.”¹

§ 19. What, let us ask next, is the ruling character of the person who produces—the creator or maker, anciently called the poet?

We have seen what a deed is. What then is a “creation”? Nay, it may be replied, to “create” cannot be said of man’s labour.

On the contrary, it not only can be said, but is and must be said continually. You certainly do not talk of creating a watch, or creating a shoe; nevertheless you *do* talk of creating a feeling. Why is this?

Look back to the greatest of all creations, that of the world. Suppose the trees had been ever so well or so ingeniously put together, stem and leaf, yet if they had not been able to grow, would they have been well created? Or suppose the fish had been cut and stitched finely out of skin and whalebone; yet, cast upon the waters, had not been able to swim? Or suppose Adam and Eve had been made in the softest clay, ever so neatly, and set at the foot of the tree of knowledge, fastened up to it, quite

¹ [See Vol. V. p. 412 for another reference to the epitaph, written by Simonides (*Anthology*, vii. 249), on the Spartans who fell at Thermopylæ (Herodotus, vii. 228).]

unable to fall, or do anything else, would they have been well created, or in any true sense created at all?

§ 20. It will, perhaps, appear to you, after a little farther thought, that to create anything in reality is to put life into it.

A poet, or creator, is therefore a person who puts things together, not as a watchmaker steel, or a shoemaker leather, but who puts life into them.

His work is essentially this: it is the gathering and arranging of material by imagination, so as to have in it at last the harmony or helpfulness of life, and the passion or emotion of life. Mere fitting and adjustment of material is nothing; that is watchmaking. But helpful and passionate harmony, essentially choral harmony, so called from the Greek word "rejoicing,"* is the harmony of Apollo and the Muses; the word Muse and Mother being derived from the same root,¹ meaning "passionate seeking," or love, of which the issue is passionate finding, or sacred INVENTION. For which reason I could not bear to use any baser word than this of invention. And if the reader will think over all these things, and follow them out, as I think he may easily with this much of clue given him, he will not any more think it wrong in me to place invention so high among the powers of man.[†] Nor any more think it strange that

* χορούς τε ὀνομακέναι παρὰ τῆς χαρᾶς ἐμφυτον ὄνομα. (De leg. II. 1.²)

† This being, indeed, among the visiblest signs of the Divine or immortal life. We have got a base habit of opposing the word "mortal" or "deathful" merely to "im-mortal"; whereas it is essentially contrary to "divine" (to θεῖος, not to ἀθανάτος, *Phædo*, 28), that which is deathful being anarchic or disobedient, and that which is divine ruling and obedient; this being the true distinction between flesh and spirit.³

¹ [The Greek μῦσα is commonly derived, as Ruskin says, from a root signifying eager desire; but the connexion of μῦση with the same root can hardly be sustained.]

² [*Laws*, 654 A. Ruskin quotes the passage from which these words come, translates it, and comments further on Plato's suggested etymology in *Munera Pulveris*, § 102 and n.]

³ [The passage in the *Phædo* (ch. xxviii., 80 A.) is: "Nature orders the soul to rule and govern, and the body to obey and serve. Now which of these two functions is akin to the divine (τῷ θεῷ)? and which to the mortal (τῷ ἄνθρωπῳ)?" In Ruskin's next note the reference is to ch. iv. (or 60 E.): "The same dream came to me

the last act of the life of Socrates* should have been to purify himself from the sin of having negligently listened to the voice within him, which, through all his past life, had bid him "labour, and make harmony."

* πολλάκις μοι φοιτῶν τὸ αὐτὸ ἐνύπνιον ἐν τῷ παρελθόντι βίῳ, ἄλλοτ' ἐν ἄλλῃ ὄψει φαίνόμενον, τὰ αὐτὰ δὲ λέγον, ὦ Σώκρατες, ἔφη, μουσικὴν ποίει καὶ ἐργάζου. (*Phaedo*, 4.)

sometimes in one form, and sometimes in another, but always saying the same or nearly the same words: Make and cultivate music, said the dream" (Jowett's version).]

CHAPTER II

THE TASK OF THE LEAST

§ 1. THE reader has probably been surprised at my assertions made often before now,¹ and reiterated here, that the *minutest* portion of a great composition is helpful to the whole. It certainly does not seem easily conceivable that this should be so. I will go farther, and say that it is inconceivable. But it is the fact.

We shall discern it to be so by taking one or two compositions to pieces, and examining the fragments. In doing which, we must remember that a great composition always has a leading emotional purpose, technically called its motive, to which all its lines and forms have some relation. Undulating lines, for instance, are expressive of action; and would be false in effect if the motive of the picture was one of repose. Horizontal and angular lines are expressive of rest and strength; and would destroy a design whose purpose was to express disquiet and feebleness. It is therefore necessary to ascertain the motive before descending to the detail.

§ 2. One of the simplest subjects, in the series of the Rivers of France, is "Rietz, near Saumur."² The published Plate gives a better rendering than usual of its tone of light; and my rough etching, Plate 73, sufficiently shows the arrangement of its lines. What is their motive?

To get at it completely, we must know something of the Loire.

¹ [See, for instance, in *Modern Painters*, Vol. IV. p. 236, Vol. V. p. 121, Vol. VI. p. 334; and compare Vol. XII. p. 60.]

² [This drawing is among those given by Ruskin to the University of Oxford: see Vol. XIII. p. 559. For another reference to it, see *The Bible of Amiens*, ch. i. § 31. It was engraved for the *Rivers of France* by Brandard, whose work is elsewhere praised by Ruskin (see Vol. XIII. p. 495).]

The district through which it here flows is, for the most part, a low place, yet not altogether at the level of the stream, but cut into steep banks of chalk or gravel, thirty or forty feet high, running for miles at about an equal height above the water.

These banks are excavated by the peasantry, partly for houses, partly for cellars, so economizing vineyard space above; and thus a kind of continuous village runs along the river-side, composed half of caves, half of rude buildings, backed by the cliff, propped against it, therefore always leaning away from the river; mingled with overlappings of vineyard trellis from above, and little towers or summer-houses for outlook, when the grapes are ripe, or for gossip over the garden wall.

§ 3. It is an autumnal evening, then, by this Loire side. The day has been hot, and the air is heavy and misty still; the sunlight warm, but dim; the brown vine-leaves motionless: all else quiet. Not a sail in sight on the river,* its strong noiseless current lengthening the stream of low sunlight.

The motive of the picture, therefore, is the expression of rude but perfect peace, slightly mingled with an indolent languor and despondency; the space between intervals of enforced labour; happy, but listless, and having little care or hope about the future; cutting its home out of this gravel bank, and letting the vine and the river twine and undermine as they will; careless to mend or build, so long as the walls hold together, and the black fruit swells in the sunshine.

§ 4. To get this repose, together with rude stability, we have therefore horizontal lines and bold angles. The grand horizontal space and sweep of Turner's distant river show perhaps better in the etching than in the Plate; but depend wholly for value on the piece of near wall. It is the

* The sails in the engraving were put in to catch the public eye. There are none in the drawing.

73. Lone side.

vertical line of its dark side which drives the eye up into the distance, right against the horizontal, and so makes it felt, while the flatness of the stone prepares the eye to understand the flatness of the river. Farther: hide with your finger the little ring on that stone, and you will find the river has stopped flowing. That ring is to repeat the curved lines of the river bank, which express its line of current, and to bring the feeling of them down near us. On the other side of the road the horizontal lines are taken up again by the dark pieces of wood, without which we should still lose half our space.

Next: The repose is to be not only perfect, but indolent: the repose of out-wearied people; not caring much what becomes of them.

You see the road is covered with litter. Even the crockery is left outside the cottage to dry in the sun, after being washed up. The steps of the cottage door have been too high for comfort originally, only it was less trouble to cut three large stones than four or five small. They are now all aslope and broken, not repaired for years. Their weighty forms increase the sense of languor throughout the scene, and of stability also, because we feel how difficult it would be to stir them. The crockery has its work to do also;—the arched door on the left being necessary to show the great thickness of walls and the strength they require to prevent falling in of the cliff above;—as the horizontal lines must be diffused on the right, so this arch must be diffused on the left; and the large round plate on one side of the steps, with the two small ones on the other, are to carry down the element of circular curvature. Hide them, and see the result.

As they carry the arched group of forms down, the arched window-shutter diffuses it upwards, where all the lines of the distant buildings suggest one and the same idea of disorderly and careless strength, mingling masonry with rock.

§ 5. So far of the horizontal and curved lines. How of

the radiating ones? What has the black vine trellis got to do?

Lay a pencil or ruler parallel with its lines. You will find that they point to the massive building in the distance. To which, as nearly as is possible without at once showing the artifice, every other radiating line points also; almost ludicrously when it is once pointed out; even the curved line of the top of the terrace runs into it, and the last sweep of the river evidently leads to its base. And so nearly is it in the exact centre of the picture, that one diagonal from corner to corner passes through it, and the other only misses the base by the twentieth of an inch.

If you are accustomed to France, you will know in a moment by its outline that this massive building is an old church.

Without it, the repose would not have been essentially the labourer's rest—rest as of the Sabbath. Among all the groups of lines that point to it, two are principal: the first, those of the vine trellis: the second, those of the handles of the saw left in the beam: the blessing of human life, and its labour.

Whenever Turner wishes to express profound repose, he puts in the foreground some instrument of labour cast aside. See, in Rogers's *Poems*, the last vignette, "Datur hora quieti," with the plough in the furrow: and in the first vignette of the same book, the scythe on the shoulder of the peasant going home. (There is nothing about the scythe in the passage of the poem which this vignette illustrates.¹)

§ 6. Observe, farther, the outline of the church itself. As our habitations are, so is our church, evidently a heap of old, but massive walls, patched, and repaired, and roofed in, and over and over, until its original shape is hardly

¹ [For the "Datur Hora Quieti," see Vol. III. p. 265; and *Elements of Drawing*, § 242 (Vol. XV. p. 206), where the symbol of the plough is further explained. The "first vignette" (not counting the frontispiece), at p. 6 of the *Poems*, is "Twilight." The drawing for it is No. 226 in the National Gallery: see Vol. XIII. p. 380.]

recognizable. I know the kind of church well—can tell even here, two miles off, that I shall find some Norman arches in the apse, and a flamboyant porch, rich and dark, with every statue broken out of it; and a rude wooden belfry above all; and a quantity of miserable shops built in among the buttresses; and that I may walk in and out as much as I please, but that how often soever, I shall always find some one praying at the Holy Sepulchre, in the darkest aisle, and my going in and out will not disturb them. For they *are* praying, which in many a handsomer and higher-furbished edifice might, perhaps, not be so assuredly the case.

§ 7. Lastly: What kind of people have we on this winding road? Three indolent ones, leaning on the wall to look over into the gliding water; and a matron with her market panniers; by her figure, not a fast rider. The road, besides, is bad, and seems unsafe for trotting, and she has passed without disturbing the cat, who sits comfortably on the block of wood in the middle of it.

§ 8. Next to this piece of quietness, let us glance at a composition in which the motive is one of tumult: that of the Fall of Schaffhausen. It is engraved in the *Keepsake*.¹ I have etched in Plate 74, at the top, the chief lines of its composition,* in which the first great purpose is to give swing enough to the water. The line of fall is straight and monotonous in reality. Turner wants to get the great concave sweep and rush of the river well felt, in spite of the unbroken form. The column of spray, rocks, mills,

* These etchings of compositions are all reversed, for they are merely sketches on the steel, and I cannot sketch easily except straight from the drawing, and without reversing. The looking-glass plagues me with cross lights. As examples of composition, it does not the least matter which way they are turned; and the reader may see this Schaffhausen subject from the right side of the Rhine, by holding the book before a glass. The rude indications of the figures in the Loire subject are nearly facsimiles of Turner's.

¹ [In the volume for 1833: called "Falls of the Rhine", engraved by J. B. Allen. The drawing, formerly in Ruskin's collection, is now in the Birmingham Art Gallery.]

and bank, all radiate like a plume, sweeping round together in grand curves to the left, where the group of figures, hurried about the ferry boat, rises like a dash of spray; they also radiating: so as to form one perfectly connected cluster, with the two *gens-d'armes* and the millstones; the millstones at the bottom being the root of it; the two soldiers laid right and left to sustain the branch of figures beyond, balanced just as a tree bough would be.

§ 9. One of the *gens-d'armes* is flirting with a young lady in a round cap and full sleeves, under pretence of wanting her to show him what she has in her bandbox. The motive of which flirtation is, so far as Turner is concerned in it, primarily the bandbox: this and the millstones below, give him a series of concave lines, which, concentrated by the recumbent soldiers, intensify the hollow sweep of the fall, precisely as the ring on the stone does the Loire eddies. These curves are carried out on the right by the small plate of eggs, laid to be washed at the spring; and, all these concave lines being a little too quiet and recumbent, the staggering casks are set on the left, and the ill-balanced milk-pail on the right, to give a general feeling of things being rolled over and over. The things which are to give this sense of rolling are dark, in order to hint at the way in which the cataract rolls boulders of rock; while the forms which are to give the sense of its sweeping force are white. The little spring, splashing out of its pine-trough, is to give contrast with the power of the fall,—while it carries out the general sense of splashing water.

§ 10. This spring exists on the spot, and so does everything else in the picture; but the combinations are wholly arbitrary; it being Turner's fixed principle to collect out of any scene, whatever was characteristic, and put it together just as he liked. The changes made in this instance are highly curious. The mills have no resemblance whatever to the real group as seen from this spot; for there is a vulgar and formal dwelling-house in front of them. But if you climb the rock behind them, you find they form

M. D. 1880

THE
ARTIST

74. The Millstream.

THE CASTLE

OF LLANFYLLEN

75 The Castle of Llanfyllen

on that side a towering cluster, which Turner has put with little modification into the drawing. What he has done to the mills, he has done with still greater audacity to the central rock. Seen from this spot, it shows, in reality, its greatest breadth, and is heavy and uninteresting; but on the Lauffen side, exposes its consumed base, worn away by the rush of water, which Turner resolving to show, serenely draws the rock as it appears from the other side of the Rhine, and brings that view of it over to this side. I have etched the bit with the rock a little larger below; and if the reader knows the spot, he will see that this piece of the drawing, reversed in the etching, is almost a *bonâ fide* unreversed study of the fall from the Lauffen side.*

Finally, the castle of Lauffen itself, being, when seen from this spot, too much foreshortened to show its extent, Turner walks a quarter of a mile lower down the river, draws the castle accurately there, brings it back with him, and puts it in all its extent, where he chooses to have it, beyond the rocks.

I tried to copy and engrave this piece of the drawing of its real size, merely to show the forms of the trees, drifted back by the breeze from the fall, and wet with its spray; but in the endeavour to facsimile the touches, great part of their grace and ease has been lost; still, Plate 75 may, if compared with the same piece in the *Keepsake* engraving, at least show that the original drawing has not yet been rendered with completeness.

§ 11. These two examples may sufficiently serve to show the mode in which minor details, both in form and spirit, are used by Turner to aid his main motives; of course I cannot, in the space of this volume, go on examining subjects at this length, even if I had time to etch them; but every design of Turner's would be equally instructive,

* With the exception of the jagged ledge rising out of the foam below, which comes from the north side, and is admirable in its expression of the position of the limestone-beds, which, rising from below the drift gravel of Constance, are the real cause of the fall of Schaffhausen.

examined in a similar manner. Thus far, however, we have only seen the help of the parts to the whole; we must give yet a little attention to the mode of combining the smallest details.

I am always led away, in spite of myself, from my proper subject here, invention formal,¹ or the merely pleasant placing of lines and masses, into the emotional results of such arrangement. The chief reason of this is that the emotional power can be explained; but the perfection of formative arrangement, as I said, cannot be explained, any more than that of melody in music. An instance or two of it, however, may be given.

§ 12. Much fine formative arrangement depends on a more or less elliptical or pear-shaped balance of the group, obtained by arranging the principal members of it on two opposite curves, and either centralizing it by some powerful feature at the base, centre, or summit; or else clasping it together by some conspicuous point or knot. A very small object will often do this satisfactorily.

If you can get the complete series of Lefèvre's engravings from Titian and Veronese,² they will be quite enough to teach you, in their dumb way, everything that is teachable of composition; at all events, try to get the Madonna, with St. Peter and St. George under the two great pillars; the Madonna and Child, with mitred bishop on her left, and St. Andrew on her right; and Veronese's Triumph of Venice.³ The first of these Plates unites two formative

¹ [See above, p. 204.]

² [Valentin Lefèvre, a Flemish painter and engraver (1642-1700); born in Brussels; during a long residence in Venice (where he died) painted in the style of Paolo Veronese, and etched numerous Plates after that master, Titian, and Tintoretto. A collection of these was published in the following large folio volume: *Opera Selectiora quæ Titianus Vecellius Cadubriensis et Paulus Calliari Veronensis, inventarunt ac pinxerunt quæ que Valentinus Le Febvre, Bruxellensis, delineavit et sculpsit*, 1682. The subjects of the Plates were not given, but a little supplementary volume, containing the particulars, was published in the following year (*Notitia dove ritrovano Opera Selectiora*, etc., 1683). For another reference to Lefèvre's Plates, see above, Part vi. ch. viii. § 13 (p. 95).]

³ [The "Madonna, with St. Peter and St. George," by Titian, is the picture in the Pesaro Chapel at the Frari: see *Stones of Venice*, vol. iii. (Vol. XI. p. 380 and n.): a reproduction of it may be seen at p. 92 of Claude Phillips' *Earlier Work of Titian*.

symmetries: that of the two pillars, clasped by the square altar-cloth below and cloud above, catches the eye first; but the main group is the fivefold one rising to the left, crowned by the Madonna. St. Francis and St. Peter form its two wings, and the kneeling portrait figures, its base. It is clasped at the bottom by the key of St. Peter, which points straight at the Madonna's head, and is laid on the steps solely for this purpose; the curved lines, which enclose the group, meet also in her face; and the straight line of light, on the cloak of the nearest senator, points at her also. If you have Turner's *Liber Studiorum*, turn to the Lauffenburg,¹ and compare the figure group there: a fivefold chain, one standing figure, central; two recumbent, for wings; two half-recumbent, for bases; and a cluster of weeds to clasp. Then turn to Lefèvre's *Europa* (there are two in the series—I mean the one with the two tree trunks over her head). It is a wonderful ninefold group. *Europa* central; two stooping figures, each surmounted by a standing one, for wings; a cupid on one side, and dog on the other, for bases: a cupid and trunk of tree, on each side, to terminate above; and a garland for clasp.

§ 13. Fig. 94, p. 226, will serve to show the mode in which similar arrangements are carried into the smallest detail. It is magnified four times from a cluster of leaves in the foreground of the "Isis" (*Liber Studiorum*).² Figs. 95

The "Madonna and Child, with Mitred Bishop," etc., is the reputed picture by Titian (though now generally acknowledged not to be by his own hand) over the altar in the chapel of the Vecelli family in the church of *Pieve di Cadore*. The picture shows the Virgin and Child between St. Andrew (supposed to represent Titian's brother, *Francesco*) and St. *Tiziano* (a Bishop of *Oderzo*); this, again, is said to be a portrait of Titian's nephew, *Marco*; behind the Bishop, in the guise of his servant, is a portrait of Titian himself. A woodcut of the picture is given at p. 98 of *Josiah Gilbert's Cadore; or, Titian's Country* (1869). The "Triumph of *Verice*" is painted on the ceiling of the *Sala del Maggior Consiglio* in the Ducal Palace; a reproduction of it is given on p. 18 of *Paolo Veronese* (Newnes' Art Library). The "Rape of *Europa*," mentioned lower down (Plate 50 in Lefèvre's book) was in Lefèvre's time in the *Casa Contarini* at Venice; it is now in the Capitoline Museum at Rome.]

¹ [The original drawing for the Plate is No. 473 in the National Gallery. For incidental references to the Plate (not, however, to the figure group), see Vol. III. p. 236 and Vol. V. p. 399.]

² [The "Temple of Isis: Scene in Petworth Park." The drawing is No. 883 in the National Gallery: for another reference to it, see *Lectures on Art*, § 170.]

and 96, page 227, show the arrangement of the two groups composing it; the lower is purely symmetrical, with trefoiled centre and broad masses for wings; the uppermost is a sweeping continuous curve, symmetrical, but foreshortened. Both

Fig. 504

are clasped by arrow-shaped leaves. The two whole groups themselves are, in turn, members of another larger group, composing the entire foreground, and consisting of broad dock-leaves, with minor clusters on the right and left, of which these form the chief portion on the right side.

§ 14. Unless every leaf, and every visible point or object, however small, forms a part of some harmony of this kind (these symmetrical conditions being only the most simple and

*Fig. 95**Fig. 96*

obvious), it has no business in the picture. It is the necessary connection of all the forms and colours, down to the last touch, which constitutes great or inventive work, separated from all common work by an impassable gulf.

By diligently copying the etchings of the *Liber Studiorum*, the reader may, however, easily attain the perception of the existence of these relations, and be prepared to understand Turner's more elaborate composition. It would take many figures to disentangle and explain the arrangements merely of the leaf cluster, Fig. 78, p. 126; but that there is a system, and that every leaf has a fixed value and place in it, can hardly but be felt at a glance.

It is curious that, in spite of all the constant talking of "composition" which goes on among art students, true composition is just the last thing which appears to be perceived. One would have thought that in this group, at least the value of the central black leaf would have been seen, of which the principal function is to point towards, and continue, the line of bank above. See Plate 62. But a glance at the published Plate in the *England* series will show that no idea of the composition had occurred to the engraver's mind.¹ He thought any leaves would do, and supplied them from his own repertory of hack vegetation.

§ 15. I would willingly enlarge farther on this subject—it is a favourite one with me; but the figures required for any exhaustive treatment of it would form a separate volume. All that I can do is to indicate, as these examples do sufficiently, the vast field open to the student's analysis if he cares to pursue the subject; and to mark for the general reader these two strong conclusions:—that nothing in great work is ever either fortuitous or contentious.

It is not fortuitous; that is to say, not left to fortune. The "must do it by a kind of felicity" of Bacon² is true; it is true also that an accident is often suggestive to an inventor. Turner himself said, "I never lose an accident." But it is this not *losing* it, this taking things out of the hands of Fortune, and putting them into those of force and

¹ [Ruskin's Plate (engraved by J. C. Armytage) faces p. 128, above; the engraver of the Plate in "*England and Wales*" (No. 6) was J. T. Willmore.]

² ["Another precept of this knowledge is . . . that [they] . . . should make a show of perpetual felicity in all that they undertake" (*Advancement of Learning*, book ii. ; xxiii. 34).]

foresight, which attest the master. Chance may sometimes help, and sometimes provoke, a success; but must never rule, and rarely allure.

And, lastly, nothing must be contentious. Art has many uses and many pleasantnesses; but of all its services, none are higher than its setting forth, by a visible and enduring image, the nature of all true authority and freedom;— Authority which defines and directs the action of benevolent law; and Freedom which consists in deep and soft consent of individual * helpfulness.

* "Individual," that is to say, distinct and separate in character, though joined in purpose. I might have enlarged on this head, but that all I should care to say has been already said admirably by Mr. J. S. Mill in his essay on *Liberty*.¹

¹ [Compare, for what Ruskin here says of liberty, Vol. V. p. 379 and *n.* For other references to Mill's book, see *Time and Tide*, § 157 and Appendix viii. (in this edition), where Ruskin refers to this passage, while from a different point of view criticising the essay severely; *Queen of the Air*, § 154 (where Ruskin says that the part of the essay which treats of freedom of thought contains "some important truths beautifully expressed," though others, "quite vital, are omitted"); and *Val d'Arno*, § 196 (where there is a passing allusion less sympathetically worded). Mill's essay had just been published (1859); a copy of the first edition, annotated by Ruskin, was in Sir John Simon's library.]

CHAPTER III

THE RULE OF THE GREATEST

§ 1. IN the entire range of art principles, none perhaps present a difficulty so great to the student, or require from the teacher expression so cautious, and yet so strong, as those which concern the nature and influence of magnitude.¹

In one sense, and that deep, there is no such thing as magnitude. The least thing is as the greatest, and one day as a thousand years,² in the eyes of the Maker of great and small things. In another sense, and that close to us and necessary, there exist both magnitude and value. Though not a sparrow falls to the ground unnoted, there are yet creatures who are of more value than many; and the same Spirit which weighs the dust of the earth in a balance, counts the isles as a little thing.

§ 2. The just temper of human mind in this matter may, nevertheless, be told shortly. Greatness can only be rightly estimated when minuteness is justly revered. Greatness is the aggregation of minuteness; nor can its sublimity be felt truthfully by any mind unaccustomed to the affectionate watching of what is least.

But if this affection for the least be unaccompanied by the powers of comparison and reflection; if it be intemperate in its thirst, restless in curiosity, and incapable of the patient and self-commandant pause which is wise to arrange, and submissive to refuse, it will close the paths of noble art to the student as effectually, and hopelessly, as even the blindness of pride, or impatience of ambition.

§ 3. I say the paths of noble art, not of useful art. All

¹ [On this subject, compare Appendix II. 3; below, p. 481.]

² [See Psalms xc. 4 and 2 Peter iii. 8; and for the following references, Matthew x. 29; Isaiah xl. 15.]

accurate investigation will have its reward; the morbid curiosity will at least slake the thirst of others, if not its own; and the diffused and petty affections will distribute, in serviceable measure, their minute delights and narrow discoveries. The opposite error, the desire of greatness as such, or rather of what appears great to indolence and vanity;—the instinct which I have described in the *Seven Lamps*,¹ noting it, among the Renaissance builders, to be an especial and unfailing sign of baseness of mind, is as fruitless as it is vile; no way profitable—every way harmful; the widest and most corrupting expression of vulgarity. The microscopic drawing of an insect may be precious; but nothing except disgrace and misguidance will ever be gathered from such work as that of Haydon or Barry.²

§ 4. The work I have mostly had to do, since this essay was begun, has been that of contention against such debased issues of swollen insolence and windy conceit; but I have noticed lately, that some lightly-budding philosophers have depreciated true greatness;³ confusing the relations of scale, as they bear upon human instinct and morality; reasoning as if a mountain were no nobler than a grain of sand, or as if many souls were not of mightier interest than one. To whom it must be shortly answered that the Lord of power and life knew which were His noblest works, when He bade His servant watch the play of the Leviathan,⁴ rather than dissect the spawn of the minnow; and that when it comes to practical question whether a single soul is to be jeopardised for many, and this Leonidas, or Curtius, or Winkelried⁵ shall abolish—so far as abolishable—his

¹ [See Vol. VIII. p. 9.]

² [For similar references to Haydon, see *Queen of the Air*, § 159, and Vol. XIV. p. 160; for Barry, Vol. III. p. 649.]

³ [The reference may possibly be to Emerson's *Essays*, a book which Ruskin was reading at this time (see below, p. 361 n., where, however, as in many other places, he expresses his obligations to that author). To the first of the *Essays*, Emerson prefixed the following lines:—

“There is no great and no small
To the Soul that maketh all.”]

⁴ [Psalms civ. 26.]

⁵ [For other references to Leonidas, see Vol. V. p. 224. Vol. XII. p. 138. And for references to Winkelried, see the letter to the *Scotsman* of July 20, 1859 (reprinted

own spirit, that he may save more numerous spirits, such question is to be solved by the simple human instinct respecting number and magnitude, not by reasoning on infinity:—

“Le navigateur, qui, la nuit, voit l’océan étinceler de lumière, danser en guirlande de feu, s’égaye d’abord de ce spectacle. Il fait dix lieues; la guirlande s’allonge indéfiniment, elle s’agite, se tord, se noue, aux mouvements de la lame; c’est un serpent monstrueux qui va toujours s’allongeant, jusqu’à trente lieues, quarante lieues. Et tout cela n’est qu’une danse d’animalcules imperceptibles. En quel nombre? À cette question l’imagination s’effraye; elle sent là une autre nature, de puissance immense, de richesse épouvantable. . . . Que sont ces petits des petits? Rien moins que les constructeurs du globe où nous sommes. De leurs corps, de leurs débris, ils ont préparé le sol qui est sous nos pas. . . . Et ce sont les plus petits qui ont fait les plus grandes choses. L’imperceptible rhizopode s’est bâti un monument bien autre que les Pyramides, pas moins que l’Italie centrale, une notable partie de la chaîne des Apennins. Mais c’était trop peu encore; les masses énormes du Chili, les prodigieuses Cordillères qui regardent le monde à leurs pieds, sont le monument funéraire où cet être insaisissable, et pour ainsi dire, invisible, a enseveli les débris de son espèce disparue.”—(Michelet : *L’Insecte*.)

§ 5. In these passages, and those connected with them in the chapter from which they are taken,¹ itself so vast in scope, and therefore so sublime, we may perhaps find the true relations of minuteness, multitude, and magnitude. We shall not feel that there is no such thing as littleness, or no such thing as magnitude. Nor shall we be disposed to confuse a Volvox with the Cordilleras; but we may learn that they both are bound together by links of eternal life and toil; we shall see the vastest thing noble, chiefly for what it includes; and the meanest for what it accomplishes. Thence we might gather—and the conclusion will be found in experience true—that the sense of largeness would be most grateful to minds capable of comprehending, balancing, and comparing; but capable also of great patience and expectation; while the sense of minute wonderfulness would be

in *Arrows of the Chace*, 1880, vol. ii. p. 6, and in a later volume of this edition); and *Poetry of Architecture*, § 43 (Vol. I. p. 38). Compare also Ruskin’s Preface (in this edition, § 19) to the *Economist* of Xenophon in *Bibliotheca Pastorum*, vol. i., where Curtius is mentioned.]

¹ [Book i. ch. iii., “Les Imperceptibles Constructeurs du Globe.” For other references to the book, see below, pp. 333 n., 450 n. An English translation of it (by W. H. Davenport Adams), with 140 illustrations by Giacomelli, was published in 1875.]

attractive to minds acted upon by sharp, small, penetrative sympathies, and apt to be impatient, irregular, and partial. This fact is curiously shown in the relations between the temper of the great composers and the modern pathetic school. I was surprised at the first rise of that school, now some years ago, by observing how they restrained themselves to subjects which in other hands would have been wholly uninteresting (compare Vol. IV., p. 19):¹ and in their succeeding efforts, I saw with increasing wonder, that they were almost destitute of the power of feeling vastness, or enjoying the forms which expressed it. A mountain or great building only appeared to them as a piece of colour of a certain shape. The powers it represented, or included, were invisible to them. In general they avoided subjects expressing space or mass, and fastened on confined, broken, and sharp forms; liking furze, fern, reeds, straw, stubble, dead leaves, and such like, better than strong stones, broad-flowing leaves, or rounded hills; in all such greater things, when forced to paint them, they missed the main and mighty lines; and this no less in what they loved than in what they disliked; for though fond of foliage, their trees always had a tendency to congeal into little acicular thorn-hedges, and never tossed free. Which modes of choice proceed naturally from a petulant sympathy with local and immediately visible interests or sorrows, not regarding their large consequences, nor capable of understanding more massive view or more deeply deliberate mercifulness;—but peevish and horror-struck, and often incapable of self-control, though not of self-sacrifice. There are more people who can forget themselves than govern themselves.

This narrowly pungent and bitter virtue has, however, its beautiful uses, and is of special value in the present day, when surface-work, shallow generalization, and cold arithmetical estimates of things, are among the chief dangers and causes of misery, which men have to deal with.

§ 6. On the other hand, and in clear distinction from all

¹ [Ruskin's reference was to the first edition; see now Vol. VI. p. 30.]

such workers, it is to be remembered that the great composers, not less deep in feeling, are in the fixed habit of regarding as much the relations and positions, as the separate nature, of things; that they reap and thresh in the sheaf, never pluck ears to rub in the hand; fish with net, not line, and sweep their prey together within great cords of errorless curve;—that nothing ever bears to them a separate or isolated aspect, but leads or links a chain of aspects—that to them it is not merely the surface, nor the substance, of anything that is of import; but its circumference and continence; that they are pre-eminently patient and reserved; observant, not curious;—comprehensive, not conjectural; calm exceedingly; unerring, constant, terrible in steadfastness of intent; unconquerable; incomprehensible; always suggesting, implying, including, more than can be told.

§ 7. And this may be seen down to their treatment of the smallest things.

For there is nothing so small but we may, as we choose, see it in the whole, or in part, and in subdued connection with other things, or in individual and petty prominence. The greatest treatment is always that which gives conception the widest range, and most harmonious guidance;—it being permitted us to employ a certain quantity of time, and certain number of touches of pencil—he who with these embraces the largest sphere of thought, and suggests within that sphere the most perfect order of thought, has wrought the most wisely, and therefore most nobly.

§ 8. I do not, however, purpose here to examine or illustrate the nature of great treatment—to do so effectually would need many examples from the figure composers; and it will be better (if I have time to work out the subject carefully) that I should do so in a form which may be easily accessible to young students.¹ Here I will only state

¹ [Here the MS. added: “A few notes on the systems of the great composers bearing on this question are placed in the Appendix.” The Appendix was not written, nor did Ruskin “work out the subject” elsewhere. An unpublished chapter, printed in the Appendix to the present volume, has, however, some bearing on the subject: see below, pp. 481 *seq.*]

in conclusion what it is chiefly important for all students to be convinced of, that all the technical qualities by which greatness of treatment is known, such as reserve in colour, tranquillity and largeness of line, and refusal of unnecessary objects of interest are, when they are real, the exponents of an habitually noble temper of mind, never the observances of a precept supposed to be useful. The refusal or reserve of a mighty painter cannot be imitated; it is only by reaching the same intellectual strength that you will be able to give an equal dignity to your self-denial. No one can tell you beforehand what to accept, or what to ignore; only remember always, in painting as in eloquence, the greater your strength, the quieter will be your manner, and the fewer your words; and in painting, as in all the arts and acts of life, the secret of high success will be found, not in a fretful and various excellence, but in a quiet singleness of justly chosen aim.

CHAPTER IV

THE LAW OF PERFECTNESS

§ 1. AMONG the several characteristics of great treatment which in the last chapter were alluded to without being enlarged upon, one will be found several times named;—reserve.

It is necessary for our present purpose that we should understand this quality more distinctly. I mean by it the power which a great painter exercises over himself in fixing certain limits, either of force, of colour, or of quantity of work;—limits which he will not transgress in any part of his picture, even though here and there a painful sense of incompleteness may exist, under the fixed conditions, and might tempt an inferior workman to infringe them. The nature of this reserve we must understand in order that we may also determine the nature of true completion or perfectness, which is the end of composition.

§ 2. For perfectness, properly so called, means harmony. The word signifies literally the doing our work *thoroughly*. It does not mean carrying it up to any constant and established degree of finish, but carrying the whole of it up to a degree determined upon.¹ In a chalk or pencil sketch by a great master, it will often be found that the deepest shades are feeble tints of pale gray; the outlines nearly invisible, and the forms brought out by a ghostly delicacy of touch, which, on looking close to the paper, will be indistinguishable from its general texture. A single line of ink, occurring anywhere in such a drawing, would of course destroy it;

¹ [On sketching and finish, see Vol. III. p. 120, and Vol. V. pp. 156 *seq.*]

placed in the darkness of a mouth or nostril, it would turn the expression into a caricature; on a cheek or brow it would be simply a blot. Yet let the blot remain, and let the master work up to it with lines of similar force; and the drawing which was before perfect, in terms of pencil will become, under his hand, perfect in terms of ink; and what was before a scratch on the cheek will become a necessary and beautiful part of its gradation.

All great work is thus reduced under certain conditions, and its right to be called complete depends on its fulfilment of them, not on the nature of the conditions chosen. Habitually, indeed, we call a coloured work which is satisfactory to us, finished, and a chalk drawing unfinished; but in the mind of the master all his work is, according to the sense in which you use the word, equally perfect or imperfect. Perfect, if you regard its purpose and limitation; imperfect, if you compare it with the natural standard. In what appears to you consummate, the master has assigned to himself terms of shortcoming, and marked with a sad severity the point up to which he will permit himself to contend with nature. Were it not for his acceptance of such restraint, he could neither quit his work, nor endure it. He could not quit it, for he would always perceive more that might be done; he could not endure it, because all doing ended only in more elaborate deficiency.

§ 3. But we are apt to forget in modern days, that the reserve of a man who is not putting forth half his strength is different in manner and dignity from the effort of one who can do no more. Charmed, and justly charmed, by the harmonious sketches of great painters, and by the grandeur of their acquiescence in the point of pause, we have put ourselves to produce sketches as an end instead of a means, and thought to imitate the painter's scornful restraint of his own power, by a scornful rejection of the things beyond ours. For many reasons, therefore, it becomes desirable to understand precisely and finally what a good painter means by completion.

§ 4. The sketches of true painters may be classed under the following heads:—

I. *Experimental*.—In which they are assisting an imperfect conception of a subject by trying the look of it on paper in different ways.

By the greatest men this kind of sketch is hardly ever made; they conceive their subjects distinctly at once, and their sketch is not to try them, but to fasten them down. Raphael's form the only important exception—and the numerous examples of experimental work by him are evidence of his composition being technical rather than imaginative. I have never seen a drawing of the kind by any great Venetian. Among the nineteen thousand sketches by Turner—which I arranged in the National Gallery—there was, to the best of my recollection, *not one*. In several instances the work, after being carried forward a certain length, had been abandoned and begun again with another view; sometimes also two or more modes of treatment had been set side by side with a view to choice. But there were always two distinct imaginations contending for realization—not experimental modifications of one.

§ 5. II. *Determinant*.—The fastening down of an idea in the simplest terms, in order that it may not be disturbed or confused by after work. Nearly all the great composers do this, methodically, before beginning a painting. Such sketches are usually in a high degree resolute and compressive; the best of them outlined or marked calmly with the pen, and deliberately washed with colour, indicating the places of the principal lights.

Fine drawings of this class never show any hurry or confusion. They are the expression of concluded operations of mind, are drawn slowly, and are not so much sketches, as maps.

§ 6. III. *Commemorative*.—Containing records of facts which the master required. These in their most elaborate form are “studies,” or drawings from Nature, of parts needed in the composition, often highly finished in the part

which is to be introduced. In this form, however, they never occur by the greatest imaginative masters. For by a truly great inventor everything is invented; no atom of the work is unmodified by his mind; and no study from Nature, however beautiful, could be introduced by him into his design without change; it would not fit with the rest. Finished studies for introduction are therefore chiefly by Leonardo and Raphael, both technical designers rather than imaginative ones.

Commemorative sketches by great masters are generally hasty, merely to put them in mind of motives of invention, or they are shorthand memoranda of things with which they do not care to trouble their memory; or, finally, accurate notes of things which they must *not* modify by invention, as local detail, costume, and such like. You may find perfectly accurate drawings of coats of arms, portions of dresses, pieces of architecture, and so on, by all the great men; but you will not find elaborate studies of bits of their pictures.

§ 7. When the sketch is made merely as a memorandum, it is impossible to say how little, or what kind of drawing, may be sufficient for the purpose. It is of course likely to be hasty from its very nature, and unless the exact purpose be understood, it may be as unintelligible as a piece of shorthand writing. For instance, in the corner of a sheet of sketches made at sea, among those of Turner, at the National Gallery, occurs this one, Fig. 97 (see next page).¹ I suppose most persons would not see much use in it. It nevertheless was probably one of the most important sketches made in Turner's life, fixing for ever in his mind certain facts respecting the sunrise from a clear sea-horizon. Having myself watched such sunrise occasionally, I perceive this sketch to mean as follows:

(Half circle at the top.) When the sun was only half

¹ [No. 438. Ruskin had already reproduced Turner's memoranda, with explanations similar to those here given, in one of his Catalogues of the Turner Sketches: see Vol. XIII. pp. 301-302. See *ibid.*, pp. 236-238, for a classification of Turner's sketches similar to the one here given.]

out of the sea, the horizon was sharply traced across its disk, and red streaks of vapour crossed the lower part of it.

(Horseshoe underneath.) When the sun had risen so far as to show three-quarters of its diameter, its light became

Fig. 97

so great as to conceal the sea-horizon, consuming it away in descending rays.

(Smaller horseshoe below.) When on the point of detaching itself from the horizon, the sun still consumed away the line of the sea, and looked as if pulled down by it.

(Broken oval.) Having risen about a fourth of its diameter above the horizon, the sea-line reappeared; but the risen orb was flattened by refraction into an oval.

(Broken circle.) Having risen a little farther above the sea-line, the sun, at last, got itself round, and all right, with sparkling reflection on the waves just below the sea-line.

This memorandum is for its purpose entirely perfect and efficient, though the sun is not drawn carefully round, but with a dash of the pencil; but there is no affected or desired slightness. Could it have been drawn round as instantaneously, it would have been. The purpose is throughout determined; there is no scrawling, as in vulgar sketching.*

§ 8. Again, Fig. 98 is a facsimile of one of Turner's "memoranda," of a complete subject,† Lausanne, from the road to Fribourg.¹

This example is entirely characteristic of his usual drawings from nature, which unite two characters, being *both* commemorative and determinant:—Commemorative, in so far as they note certain facts about the place: determinant, in that they record an impression received from the place there and then, together with the principal arrangement of the composition in which it was afterwards to be recorded. In this mode of sketching, Turner differs from all other men whose work I have studied. He never draws accurately on the spot, with the intention of modifying or composing afterwards from the materials; but instantly modifies as he draws, placing his memoranda where they are to be ultimately used, and taking exactly what he wants, not a fragment or line more.

* The word in the uppermost note, to the right of the sun, is "red"; the others, "yellow," "purple," "cold," "light grey." He always noted the colours of skies in this way.

† It is not so good a facsimile as those I have given from Dürer, for the original sketch is in light pencil; and the thickening and delicate emphasis of the lines, on which nearly all the beauty of the drawing depended, cannot be expressed in the woodcut, though marked by a double line as well as I could. But the figure will answer its purpose well enough in showing Turner's mode of sketching.

¹ [This sketch also is in the National Gallery: No. 439. See Vol. XIII, p. 302.]

§ 9. This sketch has been made in the afternoon. He had been impressed, as he walked up the hill, by the vanishing of the lake in the golden horizon, without end of waters, and by the opposition of the pinnacled castle and cathedral to its level breadth. That must be drawn! and from this spot, where all the buildings are set well together. But it lucklessly happens that, though the buildings come just where he wants them in situation, they don't in height. For the castle (the square mass on the right) is in reality higher than the cathedral, and would block out the end of the lake. Down it goes instantly a hundred feet, that we may see the lake over it; without the smallest regard for the military position of Lausanne.

§ 10. Next: The last low spire on the left is in truth concealed behind the nearer bank, the town running far down the hill (and climbing another hill) in that direction. But the group of spires, without it, would not be rich enough to give a proper impression of Lausanne, as a spiry place. Turner quietly sends to fetch the church from round the corner, places it where he likes, and indicates its distance only by aerial perspective (much greater in the pencil drawing than in the woodcut).

§ 11. But again: Not only the spire of the lower church, but the peak of the Rochers d'Enfer (that highest in the distance) would in reality be out of sight; it is much farther round to the left. This would never do either; for without it, we should have no idea that Lausanne was opposite the mountains, nor should we have a nice sloping line to lead us into the distance.

With the same unblushing tranquillity of mind in which he had ordered up the church, Turner sends also to fetch the Rochers d'Enfer; and puts *them* also where he chooses, to crown the slope of distant hill, which, as every traveller knows, in its decline to the west, is one of the most notable features of the view from Lausanne.

§ 12. These modifications, easily traceable in the large features of the design, are carried out with equal audacity

and precision in every part of it. Every one of those confused lines on the right indicates something that is really there, only everything is shifted and sorted into the exact places that Turner chose. The group of dark objects near us at the foot of the bank is a cluster of mills, which, when the picture was completed, were to be the blackest things in it, and to throw back the castle, and the golden horizon; while the rounded touches at the bottom, under the castle, indicate a row of trees, which follow a brook coming out of the ravine behind us; and were going to be made very round indeed in the picture (to oppose the spiky and angular masses of castle), and very consecutive, in order to form another conducting line into the distance.

§ 13. These motives, or motives like them, might perhaps be guessed on looking at the sketch. But no one without going to the spot would understand the meaning of the vertical lines in the left-hand lowest corner.

They are a "memorandum" of the artificial verticalness of a low sandstone cliff, which has been cut down there to give space for a bit of garden belonging to a public-house beneath, from which garden a path leads along the ravine to the Lausanne rifle-ground. The value of these vertical lines in repeating those of the cathedral, is very great; it would be greater still in the completed picture, increasing the sense of looking down from a height, and giving grasp of, and power over, the whole scene.

§ 14. Throughout the sketch, as in all that Turner made, the observing and combining intellect acts in the same manner. Not a line is lost, nor a moment of time; and though the pencil flies, and the whole thing is literally done as fast as a piece of shorthand writing, it is to the full as purposeful and compressed, so that while there are indeed dashes of the pencil which are unintentional, they are only unintentional as the form of a letter is, in fast writing, not from want of intention, but from the accident of haste.

§ 15. I know not if the reader can understand,—I myself cannot, though I see it to be demonstrable,—the

simultaneous occurrence of idea which produces such a drawing as this: the grasp of the whole, from the laying of the first line, which induces continual modifications of all that is done, out of respect to parts not done yet. No line is ever changed or effaced: no experiment made; but every touch is placed with reference to all that are to succeed, as to all that have gone before; every addition takes its part, as the stones in an arch of a bridge; the last touch locks the arch. Remove that keystone, or remove any other of the stones of the vault, and the whole will fall.

§ 16. I repeat—the power of mind which accomplishes this, is yet wholly inexplicable to me, as it was when first I defined it in the chapter on imagination associative, in the second volume.¹ But the grandeur of the power impresses me daily more and more; and, in quitting the subject of invention, let me assert finally, in clearest and strongest terms, that no painting is of any true imaginative perfectness at all, unless it has been thus conceived.

One sign of its being thus conceived may be always found in the straightforwardness of its work. There are continual disputes among artists as to the best way of doing things, which may nearly all be resolved into confessions of indetermination. If you know precisely what you want, you will not feel much hesitation in setting about it;² and a picture may be painted almost any way, so only that it be a straight way. Give a true painter a ground of black, white, scarlet, or green, and out of it he will bring what you choose. From the black, brightness; from the white, sadness; from the scarlet, coolness; from the green, glow; he will make anything out of anything, but in each case his method will be pure, direct, perfect, the shortest and simplest possible. You will find him, moreover, indifferent as to succession of process. Ask him to begin at the bottom of the picture instead of the top,—to finish two square inches of it without touching the rest, or to lay a separate ground

¹ [In this edition, Vol. IV. p. 236.]

² [Compare Mulready's saying quoted in Vol. VIII. p. 19.]

for every part before finishing any;—it is all the same to him! What he will do, if left to himself, depends on mechanical convenience, and on the time at his disposal. If he has a large brush in his hand, and plenty of one colour ground, he may lay as much as is wanted of that colour, at once, in every part of the picture where it is to occur; and if any is left, perhaps walk to another canvas, and lay the rest of it where it will be wanted on that. If, on the contrary, he has a small brush in his hand, and is interested in a particular spot of the picture, he will, perhaps, not stir from it till that bit is finished. But the absolutely best, or centrally, and entirely *right* way of painting is as follows:—

§ 17. A light ground, white, red, yellow, or gray, not brown, or black. On that an entirely accurate, and firm black outline of the whole picture, in its principal masses. The outline to be exquisitely correct as far as it reaches, but not to include small details; the use of it being to limit the masses of first colour. The ground-colours then to be laid firmly, each on its own proper part of the picture, as inlaid work in a mosaic table, meeting each other truly at the edges:¹ as much of each being laid as will get itself into the state which the artist requires it to be in for his second painting, by the time he comes to it. On this first colour, the second colours and subordinate masses laid in due order, now, of course, necessarily without previous outline, and all small detail reserved to the last, the bracelet being not touched, nor indicated in the least, till the arm is finished.*

* Thus, in the Holy Family of Titian, lately purchased for the National Gallery,² the piece of St. Catherine's dress over her shoulders is painted on the under dress, after that was dry. All its value would have been lost, had the slightest tint or trace of it been given previously. This picture, I think, and certainly many of Tintoret's, are painted on dark grounds; but this is to save time, and with some loss to the future brightness of the colour.

¹ [Compare below, pp. 415 n., 416 n.]

² [No. 635: one of the pictures in the Beaucousin Collection bought in 1860.]

§ 18. This is, as far as it can be expressed in a few words, the right, or Venetian way of painting; but it is incapable of absolute definition, for it depends on the scale, the material, and the nature of the object represented, *how much* a great painter will do with his first colour; or how many after processes he will use. Very often the first colour, richly blended and worked into, is also the last; sometimes it wants a glaze only to modify it; sometimes an entirely different colour above it. Turner's storm-blues, for instance, were produced by a black ground with opaque blue, mixed with white, struck over it.* The amount of detail given in the first colour will also depend on convenience. For instance, if a jewel *fastens* a fold of dress, a Venetian will lay probably a piece of the jewel colour in its place at the time he draws the fold; but if the jewel *falls upon* the dress, he will paint the folds only in the ground colour, and the jewel afterwards. For in the first case his hand must pause, at any rate, where the fold is fastened; so that he may as well mark the colour of the gem: but he would have to check his hand in the sweep with which he drew the drapery, if he painted a jewel that fell upon it with the first colour. So far, however, as he can possibly use the under colour, he will, in whatever he has to superimpose. There is a pretty little instance of such economical work in the painting of the pearls on the breast of the elder princess, in our best Paul Veronese (Family of Darius).¹ The lowest is about the size of a small hazel-nut, and falls on her rose-red dress. Any other but

* In cleaning the "Hero and Leander," now in the National collection, these upper glazes were taken off, and only the black ground left. I remember the picture when its distance was of the most exquisite blue. I have no doubt the "Fire at Sea" has had its distance destroyed in the same manner.²

¹ [No. 294. For other references to the picture, see Vol. XIII. p. 244 n. See also *Lectures on Landscape*, § 68, where Ruskin again noticed the picture as an example of "exquisite inlaying."]

² [The "Hero and Leander" is No. 521 (now removed to Glasgow); for other references to it, see Vol. I. p. 242 n. The "Fire at Sea" is No. 558.]

a Venetian would have put a complete piece of white paint over the dress, for the whole pearl, and painted into that the colours of the stone. But Veronese knows beforehand that all the dark side of the pearl will reflect the red of the dress. He will not put white over the red, only to put red over the white again. He leaves the actual dress for the dark side of the pearl, and with two small separate touches, one white, another brown, places its high light and shadow. This he does with perfect care and calm; but in two decisive seconds. There is no dash, nor display, nor hurry, nor error. The exactly right thing is done in the exactly right place, and not one atom of colour, nor moment of time spent vainly. Look close at the two touches,—you wonder what they mean. Retire six feet from the picture—the pearl is there!

§ 19. The degree in which the ground colours are extended over his picture, as he works, is to a great painter absolutely indifferent. It is all the same to him whether he grounds a head, and finishes it at once to the shoulders, leaving all round it white; or whether he grounds the whole picture. His harmony, paint as he will, never can be complete till the last touch is given; so long as it remains incomplete, he does not care how little of it is suggested, or how many notes are missing. All is wrong, till all is right; and he must be able to bear the all wrongness till his work is done, or he cannot paint at all. His mode of treatment will, therefore, depend on the nature of his subject, as is beautifully shown in the water-colour sketches by Turner in the National Gallery. His general system was to complete inch by inch; leaving the paper quite white all round, especially if the work was to be delicate. The most exquisite drawings left unfinished in the collection—those at Rome and Naples—are thus outlined accurately on pure white paper, begun in the middle of the sheet, and worked out to the side, finishing as he proceeds.¹ If, however,

¹ [Examples may be seen among the group numbered 326-337.]

any united effect of light or colour is to embrace a large part of the subject, he will lay it in with a broad wash over the whole paper at once; then paint into it, using it as a ground, and modifying it in the pure Venetian manner. His oil pictures were laid roughly with ground colours, and painted into with such rapid skill, that the artists who used to see him finishing at the Academy sometimes suspected him of having the picture finished underneath the colours he showed, and removing, instead of adding, as they watched.¹

§ 20. But, whatever the means used may be, the certainty and directness of them imply absolute grasp of the whole subject, and without this grasp there is no good painting. This, finally, let me declare, without qualification—that partial conception is no conception. The whole picture must be imagined, or none of it is. And this grasp of the whole implies very strange and sublime qualities of mind. It is not possible, unless the feelings are completely under control; the least excitement or passion will disturb the measured equity of power; a painter needs to be as cool as a general; and as little moved or subdued by his sense of pleasure, as a soldier by the sense of pain. Nothing good can be done without intense feeling; but it must be feeling so crushed, that the work is set about with mechanical steadiness, absolutely untroubled, as a surgeon—not without pity, but conquering it and putting it aside—begins an operation. Until the feelings can give strength enough to the will to enable it to conquer them, they are not strong enough. If you cannot leave your picture at any moment;—cannot turn from it, and go on with another, while the colour is drying;—cannot work at any part of it you choose with equal contentment—you have not firm enough grasp of it.

§ 21. It follows, also, that no vain or selfish person can possibly paint, in the noble sense of the word. Vanity and selfishness are troublous, eager, anxious, petulant:—painting

¹ [For recollections of Turner on varnishing days at the Academy, see R. C. Leslie in *Dilectu*, §§ 2, 4, 6.]

can only be done in calm of mind. Resolution is not enough to secure this; it must be secured by disposition as well. You may resolve to think of your picture only; but, if you have been fretted before beginning, no manly or clear grasp of it will be possible for you. No forced calm is calm enough. Only honest calm,—natural calm. You might as well try by external pressure to smooth a lake till it could reflect the sky, as by violence of effort to secure the peace through which only you can reach imagination. That peace must come in its own time; as the waters settle themselves into clearness as well as quietness; you can no more filter your mind into purity than you can compress it into calmness; you must keep it pure, if you would have it pure; and throw no stones into it, if you would have it quiet. Great courage and self-command may, to a certain extent, give power of painting without the true calmness underneath; but never of doing first-rate work. There is sufficient evidence of this, in even what we know of great men, though of the greatest, we nearly always know the least (and that necessarily; they being very silent, and not much given to setting themselves forth to questioners; apt to be contemptuously reserved, no less than unselfishly¹). But in such writings and sayings as we possess of theirs, we may trace a quite curious gentleness and serene courtesy. Rubens' letters are almost ludicrous in their unhurried politeness. Reynolds, swiftest of painters, was gentlest of companions; so also Velasquez, Titian, and Veronese.²

§ 22. It is gratuitous to add that no shallow or petty person can paint. Mere cleverness or special gift never made an artist. It is only perfectness of mind, unity, depth, decision,—the highest qualities, in fine, of the intellect, which will form the imagination.

§ 23. And, lastly, no false person can paint. A person false at heart may, when it suits his purposes, seize a stray

¹ [For notices of Turner in this respect, "silent as a granite crest," see Vol. V. p. 275, and Vol. XIII. p. 109.]

² [Compare the biographical notes given in *Two Paths*, § 64 (Vol. XVI. p. 308).]

truth here or there; but the relations of truth,—its perfectness,—that which makes it wholesome truth, he can never perceive. As wholeness and wholesomeness go together, so also sight with sincerity; it is only the constant desire of and submissiveness to truth, which can measure its strange angles and mark its infinite aspects; and fit them and knit them into the strength of sacred invention.

Sacred, I call it deliberately; for it is thus, in the most accurate senses, humble as well as helpful; meek in its receiving, as magnificent in its disposing; the name it bears being rightly given even to invention formal, not because it forms, but because it finds. For you cannot find a lie; you must make it for yourself. False things may be imagined, and false things composed; but only truth can be invented.¹

¹ [So also of the imagination, "the base of whose authority and being is its perpetual thirst for truth": see Vol. IV. pp. 284-285.]

FART IX

OF IDEAS OF RELATION :—SECOND,
OF INVENTION SPIRITUAL

CHAPTER I

THE DARK MIRROR

§ 1. IN the course of our inquiry into the moral of landscape (Vol. III., Chap. xvii.),¹ we promised at the close of our work to seek for some better, or at least clearer, conclusions than were then possible to us. We confined ourselves in that chapter to the vindication of the probable utility of the *love* of natural scenery. We made no assertion of the usefulness of *painting* such scenery. It might be well to delight in the real country, or admire the real flowers and true mountains. But it did not follow that it was advisable to paint them.

Far from it. Many reasons might be given why we should not paint them. All the purposes of good which we saw that the beauty of Nature could accomplish, may be better fulfilled by the meanest of her realities, than by the brightest of imitations. For prolonged entertainment, no picture can be compared with the wealth of interest which may be found in the herbage of the poorest field, or blossoms of the narrowest copse. As suggestive of supernatural power, the passing away of a fitful raincloud, or opening of dawn, are in their change and mystery more pregnant than any pictures. A child would, I suppose, receive a religious lesson from a flower more willingly than from a print of one; and might be taught to understand the nineteenth Psalm,² on a starry night, better than by diagrams of the constellations.

¹ [See in this edition, Vol. V. p. 384.]

² [See the commentary on this Psalm already given; above, Part vii. ch. iv. pp. 195 *seq.*]

Whence it might seem a waste of time to draw landscape at all.

I believe it is;—to draw landscape mere and solitary, however beautiful (unless it be for the sake of geographical or other science, or of historical record). But there is a kind of landscape which it is not inexpedient to draw. What kind, we may probably discover by considering that which mankind has hitherto contented itself with painting.

§ 2. We may arrange nearly all existing landscape under the following heads:—

I. **HEROIC.**—Representing an imaginary world, inhabited by men not perhaps perfectly civilized, but noble, and usually subjected to severe trials, and by spiritual powers of the highest order. It is frequently without architecture; never without figure-action, or emotion. Its principal master is Titian.

II. **CLASSICAL.**—Representing an imaginary world, inhabited by perfectly civilized men, and by spiritual powers of an inferior order.

It generally assumes this condition of things to have existed among the Greek and Roman nations. It contains usually architecture of an elevated character, and always incidents of figure-action, or emotion. Its principal master is Nicolo Poussin.

III. **PASTORAL.**—Representing peasant life and its daily work, or such scenery as may naturally be suggestive of it, consisting usually of simple landscape, in part subjected to agriculture, with figures, cattle, and domestic buildings. No supernatural being is ever visibly present. It does not in ordinary cases admit architecture of an elevated character nor exciting incident. Its principal master is Cuyp.

IV. **CONTEMPLATIVE.**—Directed principally to the observance of the powers of Nature, and record of the historical associations connected with landscape, illustrated by, or contrasted with, existing states of human life. No supernatural being is visibly present. It admits every variety of

subject, and requires, in general, figure incident, but not of an exciting character. It was not developed completely until recent times. Its principal master is Turner.*

§ 3. These are the four true orders of landscape, not of course distinctly separated from each other in all cases, but very distinctly in typical examples. Two spurious forms require separate note.

(A) PICTURESQUE.—This is indeed rather the degradation (or sometimes the undeveloped state) of the contemplative, than a distinct class; but it may be considered generally as including pictures meant to display the skill of the artist, and his powers of composition; or to give agreeable forms and colours, irrespective of sentiment. It will include much modern art, with the street views and church interiors of the Dutch, and the works of Canaletto, Guardi, Tempesta, and the like.

(B) HYBRID.—Landscape in which the painter endeavours to unite the irreconcilable sentiment of two or more of the above-named classes. Its principal masters are Berghem and Wouvermans.

§ 4. Passing for the present by these inferior schools, we find that all true landscape, whether simple or exalted, depends primarily for its interest on connection with humanity, or with spiritual powers. Banish your heroes and nymphs from the classical landscape—its laurel shades will move you no more. Show that the dark clefts of the most romantic mountain are uninhabited and untraversed; it will cease to be romantic. Fields without shepherds and without fairies will have no gaiety in their green, nor will the noblest masses of ground or colours of cloud arrest or raise

* I have been embarrassed in assigning the names to these orders of art, the term "Contemplative" belonging in justice nearly as much to the romantic and pastoral conception as to the modern landscape. I intended, originally, to call the four schools—Romantic, Classic, Georgic, and Theoretic—which would have been more accurate; and more consistent with the nomenclature of the second volume; but would not have been pleasant in sound, nor, to the general reader, very clear in sense.

your thoughts, if the earth has no life to sustain, and the heaven none to refresh.¹

§ 5. It might perhaps be thought that, since from scenes in which the figure was principal, and landscape symbolical and subordinate (as in the art of Egypt), the process of ages had led us to scenes in which landscape was principal and the figure subordinate, — a continuance in the same current of feeling might bring forth at last an art from which humanity and its interests should wholly vanish, leaving us to the passionless admiration of herbage and stone. But this will not, and cannot be.² For observe the parallel instance in the gradually increasing importance of dress. From the simplicity of Greek design, concentrating, I suppose, its skill chiefly on the naked form, the course of time developed conditions of Venetian imagination which found nearly as much interest, and expressed nearly as much dignity, in folds of dress and fancies of decoration as in the faces of the figures themselves: so that if from Veronese's *Marriage in Cana*³ we remove the architecture and the gay dresses, we shall not in the faces and hands remaining, find a satisfactory abstract of the picture. But try it the other way. Take out the faces; leave the draperies, and how then? Put the fine dresses and jewelled girdles into the best group you can; paint them with all Veronese's skill: will they satisfy you?

§ 6. Not so. As long as they are in their due service and subjection—while their folds are formed by the motion of men, and their lustre adorns the nobleness of men—so long the lustre and the folds are lovely. But cast them from the human limbs;—golden circlet and silken tissue are withered; the dead leaves of autumn are more precious than they.

This is just as true, but in a far deeper sense, of the

¹ [Compare the passage at the beginning of ch. vi. of *Seven Lamps* (Vol. VIII. p. 223).]

² [In his copy Ruskin here wrote in the margin: "It has been in photography and such art—no otherwise."]

³ [For this picture, see Vol. VI. p. 86; Vol. XI. p. 359; Vol. XII. pp. 451, 503.]

weaving of the natural robe of man's soul. Fragrant tissue of flowers, golden circlets of clouds, are only fair when they meet the fondness of human thoughts, and glorify human visions of heaven.

§ 7. It is the leaning on this truth which, more than any other, has been the distinctive character of all my own past work. And in closing a series of Art-studies, prolonged during so many years, it may be perhaps permitted me to point out this specialty—the rather that it has been, of all their characters, the one most denied. I constantly see that the same thing takes place in the estimation formed by the modern public of the work of almost any true person, living or dead. It is not needful to state here the causes of such error; but the fact is indeed so, that precisely the distinctive root and leading force of any true man's work and way are the things denied concerning him.¹

And in these books of mine, their distinctive character, as essays on art, is their bringing everything to a root in human passion or human hope. Arising first not in any desire to explain the principles of art, but in the endeavour to defend an individual painter from injustice, they have been coloured throughout,—nay, continually altered in shape, and even warped and broken, by digressions respecting social questions, which had for me an interest tenfold greater than the work I had been forced into undertaking. Every principle of painting which I have stated is traced to some vital or spiritual fact; and in my works on architecture the preference accorded finally to one school over another, is founded on a comparison of their influences on the life of the workman—a question by all other writers on the subject of architecture wholly forgotten or despised.

¹ [The MS. here continues :—

“Thus in Turner, the distinctive mark which separated him from all other painters of his time, so far as method went, was his perpetual use to the end of his life of the Pencil point instead of the brush in drawing from nature, and his consequent power of Drawing more subtly than any contemporary painter. It was precisely *this* which the public mainly denied concerning him. He might do everything else well—but he could not Draw !”

For this point, see Vol. XIII. pp. 242 *seq.*]

§ 8. The essential connection of the power of landscape with human emotion is not less certain, because in many impressive pictures the link is slight or local. That the connection should exist at a single point is all that we need. The comparison with the dress of the body may be carried out into the extremest parallelism. It may often happen that no part of the figure wearing the dress is discernible, nevertheless, the perceivable fact that the drapery is worn by a figure makes all the difference. In one of the most sublime figures in the world this is actually so: one of the fainting Maries in Tintoret's Crucifixion¹ has cast her mantle over her head, and her face is lost in its shade, and her whole figure veiled in folds of gray. But what the difference is between that gray woof, that gathers round her as she falls, and the same folds cast in a heap upon the ground, that difference, and more, exists between the power of Nature through which humanity is seen, and her power in the desert. Desert—whether of leaf or sand—true desertness is not in the want of leaves, but of life. Where humanity is not, and was not, the best natural beauty is more than vain. It is even terrible; not as the dress cast aside from the body; but as an embroidered shroud hiding a skeleton.

§ 9. And on each side of a right feeling in this matter there lie, as usual, two opposite errors.

The first, that of caring for man only; and for the rest of the universe, little, or not at all, which, in a measure, was the error of the Greeks and Florentines; the other, that of caring for the universe only;—for man, not at all—which, in a measure, is the error of modern science, and of the Art connecting itself with such science.

The degree of power which any man may ultimately possess in landscape-painting will depend finally on his perception of this influence. If he has to paint the desert, its awfulness—if the garden, its gladsomeness—will arise

¹ [For other references to this picture, see below, p. 289; and Vol. IV. p. 270.]

simply and only from his sensibility to the story of life. Without this he is nothing but a scientific mechanist; this, though it cannot make him yet a painter, raises him to the sphere in which he may become one. Nay, the mere shadow and semblance of this have given dangerous power to works in all other respects unnoticeable; and the least degree of its true presence has given value to work in all other respects vain.

The true presence, observe, of sympathy with the spirit of man. Where this is not, sympathy with any higher spirit is impossible.

For the directest manifestation of Deity to man is in His own image, that is, in man.

§ 10. "In His own image. After His likeness." *Ad imaginem et Similitudinem Suam*.¹ I do not know what people in general understand by those words. I suppose they ought to be understood. The truth they contain seems to lie at the foundation of our knowledge both of God and man; yet do we not usually pass the sentence by, in dull reverence, attaching no definite sense to it at all? For all practical purpose, might it not as well be out of the text?

I have no time, nor much desire, to examine the vague expressions of belief with which the verse has been encumbered. Let us try to find its only possible plain significance.

§ 11. It cannot be supposed that the bodily shape of man resembles, or resembled, any bodily shape in Deity. The likeness must therefore be, or have been, in the soul. Had it wholly passed away, and the divine soul been altered into a soul brutal or diabolic, I suppose we should have been told of the change. But we are told nothing of the kind. The verse still stands as if for our use and trust. It was only death which was to be our punishment. Not *change*. So far as we live, the image is still there;

¹ [Genesis i. 26: the Vulgate.]

defiled, if you will; broken, if you will; all but effaced, if you will, by death and the shadow of it. But not changed. We are not made now in any other image than God's. There are, indeed, the two states of this image—the earthly and heavenly, but both Adamite, both human, both the same likeness; only one defiled, and one pure. So that the soul of man is still a mirror, wherein may be seen, darkly, the image of the mind of God.¹

These may seem daring words. I am sorry that they do; but I am helpless to soften them. Discover any other meaning of the text if you are able;—but be sure that it *is* a meaning—a meaning in your head and heart;—not a subtle gloss, nor a shifting of one verbal expression into another, both idealess. I repeat that, to me, the verse has, and can have, no other signification than this—that the soul of man is a mirror of the mind of God. A mirror, dark, distorted, broken, use what blameful words you please of its state; yet in the main, a true mirror, out of which alone, and by which alone, we can know anything of God at all.

“How?” the reader, perhaps, answers indignantly. “I know the nature of God by revelation, not by looking into myself.”

Revelation to what? To a nature incapable of receiving truth? That cannot be; for only to a nature capable of truth, desirous of it, distinguishing it, feeding upon it, revelation is possible. To a being undesirous of it, and hating it, revelation is impossible. There can be none to a brute, or fiend. In so far, therefore, as you love truth, and live therein, in so far revelation can exist for you;—and in so far, your mind is the image of God's.

§ 12. But consider, farther, not only *to* what, but *by* what, is the revelation. By sight? or word? If by sight, then to eyes which see justly. Otherwise, no sight would be revelation. So far, then, as your sight is just, it is the image of God's sight.

¹ [See 1 Corinthians xiii. 12.]

If by words,—how do you know their meanings? Here is a short piece of precious word revelation, for instance. “God is love.”¹

Love! yes. But what is *that*? The revelation does not tell you that, I think. Look into the mirror, and you will see. Out of your own heart, you may know what love is. In no other possible way,—by no other help or sign. All the words and sounds ever uttered, all the revelations of cloud, or flame, or crystal, are utterly powerless. They cannot tell you, in the smallest point, what love means. Only the broken mirror can.

§ 13. Here is more revelation. “God is just!”² Just! What is that? The revelation cannot help you to discover. You say it is dealing equitably or equally. But how do you discern the equality? Not by inequality of mind; not by a mind incapable of weighing, judging, or distributing. If the lengths seem unequal in the broken mirror, for you they are unequal; but if they seem equal, then the mirror is true. So far as you recognize equality, and your conscience tells you what is just, so far your mind is the image of God’s; and so far as you do *not* discern this nature of justice or equality, the words “God is just” bring no revelation to you.

§ 14. “But His thoughts are not as our thoughts.”³ No; the sea is not as the standing pool by the wayside. Yet when the breeze crisps the pool, you may see the image of the breakers, and a likeness of the foam. Nay, in some sort, the same foam. If the sea is for ever invisible to you, something you may learn of it from the pool. Nothing, assuredly, any otherwise.

“But this poor miserable Me! Is *this*, then, all the book I have got to read about God in?” Yes, truly so. No other book, nor fragment of book, than that, will you ever find; no velvet-bound missal, nor frankincensed

¹ [1 John iv. 16.]

² [See Deuteronomy xxxii. 4.]

³ [Isaiah lv. 8.]

manuscript;—nothing hieroglyphic nor cuneiform; papyrus and pyramid are alike silent on this matter;—nothing in the clouds above, nor in the earth beneath.¹ That flesh-bound volume is the only revelation that is, that was, or that can be. In that is the image of God painted; in that is the law of God written; in that is the promise of God revealed. Know thyself; for through thyself only thou canst know God.

§ 15. Through the glass, darkly.² But, except through the glass, in nowise.

A tremulous crystal, waved as water, poured out upon the ground;—you may defile it, despise it, pollute it, at your pleasure and at your peril; for on the peace of those weak waves must all the heaven you shall ever gain be first seen; and through such purity as you can win for those dark waves, must all the light of the risen Sun of Righteousness be bent down, by faint refraction. Cleanse them, and calm them, as you love your life.

Therefore it is that all the power of nature depends on subjection to the human soul.³ Man is the sun of the world; more than the real sun. The fire of his wonderful heart is the only light and heat worth gauge or measure. Where he is, are the tropics; where he is not, the ice-world.

¹ [See Exodus xx. 4.]

² [1 Corinthians xiii. 12.]

³ [With the conclusion reached in this chapter, compare *Lectures on Landscape*, § 1, and *Laws of Fésale*, ch. viii. § 16 (Vol. XV. p. 438).]

CHAPTER II

THE LANCE OF PALLAS

§ 1. IT might be thought that the tenor of the preceding chapter was in some sort adverse to my repeated statement¹ that all great art is the expression of man's delight in God's work, not in *his own*. But observe, he is not himself his own work: he is himself precisely the most wonderful piece of God's workmanship extant. In this best piece not only he is bound to take delight, but cannot, in a right state of thought, take delight in anything else, otherwise than through himself. Through himself, however, as the sun of creation, not as *the* creation. In himself, as the light of the world.* Not as being the world. Let him stand in his due relation to other creatures, and to inanimate things—know them all and love them, as made for him, and he for them;—and he becomes himself the greatest and holiest of them. But let him cast off this relation, despise and forget the less creation round him, and instead of being the light of the world, he is a sun in space—a fiery ball, spotted with storm.

§ 2. All the diseases of mind leading to fatalest ruin consist primarily in this isolation. They are the concentration of man upon himself, whether his heavenly interests or his worldly interests, matters not; it is the being *his own* interests which makes the regard of them so mortal. Every form of asceticism on one side, of sensualism on the other, is an isolation of his soul or of his body; the fixing his

* Matt. v. 14

¹ [See, for instance, *Stones of Venice*, vol. i. (Vol. IX. p. 10); *Harbours of England*, § 19 (Vol. XIII. p. 29); *Two Paths*, § 48 (Vol. XVI. p. 29C).]

thoughts upon them alone; while every healthy state of nations and of individual minds consists in the unselfish presence of the human spirit everywhere, energizing over all things; speaking and living through all things.

§ 3. Man being thus the crowning and ruling work of God, it will follow that all his best art must have something to tell about himself, as the soul of things, and ruler of creatures. It must also make this reference to himself under a true conception of his own nature. Therefore all art which involves no reference to man is inferior or nugatory. And all art which involves misconception of man, or base thought of him, is in that degree false and base.

Now the basest thought possible concerning him is, that he has no spiritual nature; and the foolishlest misunderstanding of him possible is, that he has or should have, no animal nature. For his nature is nobly animal, nobly spiritual—coherently and irrevocably so; neither part of it may, but at its peril, expel, despise, or defy the other. All great art confesses and worships both.

§ 4. The art which, since the writings of Rio and Lord Lindsay,¹ is specially known as “Christian,” erred by pride in its denial of the animal nature of man;—and, in connection with all monkish and fanatical forms of religion, by looking always to another world instead of this. It wasted its strength in visions, and was therefore swept away, notwithstanding all its good and glory, by the strong truth of the naturalist art of the sixteenth century. But that naturalist art erred on the other side; denied at last the spiritual nature of man, and perished in corruption.

A contemplative reaction is taking place in modern times, out of which it may be hoped a new spiritual art may be developed. The first school of landscape, named, in the foregoing chapter, the Heroic, is that of the noble naturalists. The second (Classical), and third (Pastoral), belong to the time of sensual decline. The fourth (Contemplative) is that of modern revival.

¹ [For Rio's book, see Vol. IV. p. xxiii.; and for Lord Lindsay's, Vol. XII. p. xxxix.]

§ 5. But why, the reader will ask, is no place given in this scheme to the "Christian" or spiritual art which preceded the naturalists? Because all landscape belonging to that art is subordinate, and in one essential principle false. It is subordinate, because intended only to exalt the conception of saintly or Divine presence:—rather therefore to be considered as a landscape decoration or type, than an effort to paint nature. If I included it in my list of schools, I should have to go still farther back, and include with it the conventional and illustrative landscape of the Greeks and Egyptians.

§ 6. But also it cannot constitute a real school, because its first assumption is false, namely, that the natural world can be represented without the element of death.

The real schools of landscape are primarily distinguished from the preceding unreal ones by their introduction of this element. They are not at first in any sort the worthier for it. But they are more true, and capable, therefore, in the issue, of becoming worthier.

It will be a hard piece of work for us to think this rightly out, but it must be done.

§ 7. Perhaps an accurate analysis of the schools of art of all time might show us that when the immortality of the soul was practically and completely believed, the elements of decay, danger, and grief in visible things were always disregarded. However this may be, it is assuredly so in the early Christian schools. The ideas of danger or decay seem not merely repugnant, but inconceivable to them; the expression of immortality and perpetuity is alone possible. I do not mean that they take no note of the absolute fact of corruption. This fact the early painters often compel themselves to look fuller in the front than any other men: as in the way they usually paint the Deluge (the raven feeding on the bodies), and in all the various triumphs and processions of the power of Death, which formed one great chapter of religious teaching and painting, from Orcagna's¹

¹ [For Orcagna's "Triumph of Death," see Vol. XII. p. 224.]

time to the close of the Purist epoch. But I mean that this external fact of corruption is separated in their minds from the main conditions of their work; and its horror enters no more into their general treatment of landscape than the fear of murder or martyrdom, both of which they had nevertheless continually to represent. None of these things appeared to them as affecting the general dealings of the Deity with His world. Death, pain, and decay were simply momentary accidents in the course of immortality, which never ought to exercise any depressing influence over the hearts of men, or in the life of Nature. God, in intense life, peace, and helping power, was always and everywhere. Human bodies, at one time or another, had indeed to be made dust of, and raised from it; and this becoming dust was hurtful and humiliating, but not in the least melancholy, nor, in any very high degree, important; except to thoughtless persons who needed sometimes to be reminded of it, and whom, not at all fearing the things much himself, the painter accordingly did remind of it, somewhat sharply.

§ 8. A similar condition of mind seems to have been attained, not unfrequently, in modern times, by persons whom either narrowness of circumstance or education, or vigorous moral efforts, have guarded from the troubling of the world, so as to give them firm and childlike trust in the power and presence of God, together with peace of conscience, and a belief in the passing of all evil into some form of good. It is impossible that a person thus disciplined should feel, in any of its more acute phases, the sorrow for any of the phenomena of nature, or terror in any material danger which would occur to another. The absence of personal fear, the consciousness of security as great in the midst of pestilence and storm, as amidst beds of flowers on a summer's morning, and the certainty that whatever appeared evil, or was assuredly painful, must eventually issue in a far greater and enduring good—this general feeling and conviction, I say, would gradually lull, and at last put to

entire rest, the physical sensations of grief and fear; so that the man would look upon danger without dread,—expect pain without lamentation.

§ 9. It may perhaps be thought that this is a very high and right state of mind.

Unfortunately, it appears that the attainment of it is never possible without inducing some form of intellectual weakness.

No painter belonging to the purist¹ religious schools ever mastered his art. Perugino nearly did so; but it was because he was more rational—more a man of the world—than the rest. No literature exists of a high class produced by minds in the pure religious temper. On the contrary, a great deal of literature exists, produced by persons in that temper, which is markedly, and very far, below average literary work.

§ 10. The reason of this I believe to be, that the right faith of man is not intended to give him repose, but to enable him to do his work. It is not intended that he should look away from the place he lives in now, and cheer himself with thoughts of the place he is to live in next, but that he should look stoutly into this world, in faith that if he does his work thoroughly here, some good to others or himself, with which however he is not at present concerned, will come of it hereafter. And this kind of brave, but not very hopeful or cheerful faith, I perceive to be always rewarded by clear practical success and splendid intellectual power; while the faith which dwells on the future fades away into rosy mist, and emptiness of musical air. That result indeed follows naturally enough on its habit of assuming that things must be right, or must come right, when, probably, the fact is, that so far as we are concerned, they are entirely wrong; and going wrong: and also on its weak and false way of looking on what these religious persons call “the bright side of things,” that is to say, on

¹ [“Purest” in all previous editions; but the MS. has “purist,” which is doubtless the word Ruskin intended: see the “Purist Ideal” in *Modern Painters*, vol. iii.]

one side of them only, when God has given them two sides, and intended us to see both.

§ 11. I was reading but the other day, in a book by a zealous, useful, and able Scotch clergyman, one of these rhapsodies, in which he described a scene in the Highlands to show (he said) the goodness of God. In this Highland scene there was nothing but sunshine, and fresh breezes, and bleating lambs, and clean tartans, and all manner of pleasantness. Now a Highland scene is, beyond dispute, pleasant enough in its own way; but, looked close at, has its shadows.¹ Here, for instance, is the very fact of one, as pretty as I can remember—having seen many. It is a little valley of soft turf, enclosed in its narrow oval by jutting rocks and broad flakes of nodding fern. From one side of it to the other winds, serpentine, a clear brown stream, drooping into quicker ripple as it reaches the end of the oval field, and then, first islanding a purple and white rock with an amber pool, it dashes away into a narrow fall of foam under a thicket of mountain-ash and alder. The autumn sun, low but clear, shines on the scarlet ash-berries and on the golden birch-leaves, which, fallen here and there, when the breeze has not caught them, rest quiet in the crannies of the purple rock. Beside the rock, in the hollow under the thicket, the carcass of a ewe, drowned in the last flood, lies nearly bare to the bone, its white ribs protruding through the skin, raven-torn; and the rags of its wool still flickering from the branches that first stayed it as the stream swept it down. A little lower, the current plunges, roaring, into a circular chasm like a well, surrounded on three sides by a chimney-like hollowness of polished rock, down which the foam slips in detached

¹ [The passage "A Highland scene" down to "so sharp as they" is § 87 in *Frondees Agrestes*, where at this point Ruskin added the following footnote:—

"Passage written to be opposed to an exuberant description, by an amiable Scottish pastor, of everything flattering to Scotchmen in the Highlands. I have put next to it, a little study of the sadness of Italy."

The "study of the sadness of Italy" (§ 88 in *Frondees*) is the description of the Campagna under evening light from the first volume of *Modern Painters*, preface to second edition, § 37 (Vol. III. p. 42).]

snow-flakes. Round the edges of the pool beneath, the water circles slowly, like black oil; a little butterfly lies on its back, its wings glued to one of the eddies, its limbs feebly quivering; a fish rises, and it is gone. Lower down the stream, I can just see over a knoll, the green and damp turf roofs of four or five hovels, built at the edge of a morass, which is trodden by the cattle into a black Slough of Despond at their doors, and traversed by a few ill-set stepping-stones, with here and there a flat slab on the tops, where they have sunk out of sight, and at the turn of the brook I see a man fishing, with a boy and a dog—a picturesque and pretty group enough certainly, if they had not been there all day starving. I know them, and I know the dog's ribs also, which are nearly as bare as the dead ewe's; and the child's wasted shoulders, cutting his old tartan jacket through, so sharp are they. We will go down and talk with the man.

§ 12. Or, that I may not piece pure truth with fancy, for I have none of his words set down, let us hear a word or two from another such, a Scotchman also, and as true-hearted, and in just as fair a scene. I write out the passage, in which I have kept his few sentences, word for word, as it stands in my private diary:—"22nd April (1851). Yesterday I had a long walk up the Via Gellia, at Matlock, coming down upon it from the hills above, all sown with anemones and violets, and murmuring with sweet springs. Above all the mills in the valley, the brook, in its first purity, forms a small shallow pool, with a sandy bottom covered with cresses and other water plants. A man was wading in it for cresses as I passed up the valley, and bade me good-day. I did not go much farther; he was there when I returned. I passed him again, about one hundred yards, when it struck me I might as well learn all I could about watercresses: so I turned back. I asked the man, among other questions, what he called the common weed, something like watercress, but with a serrated leaf, which grows at the edge of nearly all such pools. 'We calls that

brooklime, hereabouts,' said a voice behind me. I turned, and saw three men, miners or manufacturers—two evidently Derbyshire men, and respectable-looking in their way; the third, thin, poor, old, and harder-featured, and utterly in rags. 'Brooklime?' I said. 'What do you call it lime for?' The man said he did not know; it was called that. 'You'll find that in the British 'Erba,' said the weak, calm voice of the old man. I turned to him in much surprise; but he went on saying something drily (I hardly understood what) to the cress-gatherer; who contradicting him, the old man said he 'didn't know fresh water,' he 'knew enough of sa't.' 'Have you been a sailor?' I asked. 'I was a sailor for eleven years and ten months of my life,' he said, in the same strangely quiet manner. 'And what are you now?' 'I lived for ten years after my wife's death by picking up rags and bones; I hadn't much occasion afore.' 'And now how do you live?' 'Why, I lives hard and honest, and haven't got to live long,' or something to that effect. He then went on, in a kind of maundering way, about his wife. 'She had rheumatism and fever very bad; and her second rib growed over her hench-bone. A' was a clever woman, but a' grow'd to be a very little one' (this, with an expression of deep melancholy). 'Eighteen years after her first lad she was in the family-way again, and they had doctors up from Lunnon about it. They wanted to rip her open, and take the child out of her side. But I never would give my consent.' (Then, after a pause:) 'She died twenty-six hours and ten minutes after it. I never cared much what come of me since; but I know that I shall soon reach her; that's a knowledge I would na gie for the king's crown.' 'You are a Scotchman, are not you?' I asked. 'I'm from the Isle of Skye, sir; I'm a McGregor.' I said something about his religious faith. 'Ye'll know I was bred in the Church of Scotland, sir,' he said, 'and I love it as I love my own soul: but I think thae Wesleyan Methodists ha' got salvation among them too.'"

Truly, this Highland and English hill-scenery is fair

enough; but has its shadows; and deeper colouring, here and there, than that of heath and rose.

§ 13. Now, as far as I have watched the main powers of human mind, they have risen first from the resolution to see fearlessly, pitifully, and to its very worst, what these deep colours mean, wheresoever they fall; not by any means to pass on the other side, looking pleasantly up to the sky, but to stoop to the horror, and let the sky, for the present, take care of its own clouds. However this may be in moral matters, with which I have nothing here to do, in my own field of inquiry the fact is so; and all great and beautiful work has come of first gazing without shrinking into the darkness. If, having done so, the human spirit can, by its courage and faith, conquer the evil, it rises into conceptions of victorious and consummated beauty. It is then the spirit of the highest Greek and Venetian Art. If unable to conquer the evil, but remaining in strong though melancholy war with it, not rising into supreme beauty, it is the spirit of the best northern art, typically represented by that of Holbein and Dürer. If, itself conquered by the evil, infected by the dragon breath of it, and at last brought into captivity, so as to take delight in evil for ever, it becomes the spirit of the dark, but still powerful sensualistic art, represented typically by that of Salvator. We must trace this fact briefly through Greek, Venetian, and Düreresque art; we shall then see how the art of decline came of avoiding the evil, and seeking pleasure only; and thus obtain, at last, some power of judging whether the tendency of our own contemplative art be right or ignoble.

§ 14. The ruling purpose of Greek poetry is the assertion of victory, by heroism, over fate, sin, and death. The terror of these great enemies is dwelt upon chiefly by the tragedians. The victory over them, by Homer.

The adversary chiefly contemplated by the tragedians is Fate, or predestinate misfortune. And that under three principal forms.

(A) Blindness or ignorance; not in itself guilty, but

inducing acts which otherwise would have been guilty; and leading, no less than guilt, to destruction.*

(B) Visitation upon one person of the sin of another.

(c) Repression by brutal, or tyrannous strength, of a benevolent will.

§ 15. In all these cases sorrow is much more definitely connected with sin by the Greek tragedians than by Shakspeare. The "fate" of Shakspeare is, indeed, a form of blindness, but it issues in little more than haste or indiscretion. It is, in the literal sense, "fatal," but hardly criminal.

The "I am fortune's fool" of Romeo,¹ expresses Shakspeare's primary idea of tragic circumstance. Often his victims are entirely innocent, swept away by mere current of strong encompassing calamity (Ophelia, Cordelia, Arthur, Queen Katherine). This is rarely so with the Greeks. The victim may indeed be innocent, as Antigone, but is in some way resolutely entangled with crime, and destroyed by it, as if it struck by pollution, no less than participation.

The victory over sin and death is therefore also with the Greek tragedians more complete than with Shakspeare. As the enemy has more direct moral personality,—as it is sinfulness more than mischance, it is met by a higher moral resolve, a greater preparation of heart, a more solemn patience and purposed self-sacrifice. At the close of a Shakspeare tragedy, nothing remains but dead march and clothes of burial. At the close of a Greek tragedy there

* The speech of Achilles to Priam expresses this idea of fatality and submission clearly, there being two vessels—one full of sorrow, the other of great and noble gifts (a sense of disgrace mixing with that of sorrow, and of honour with that of joy), from which Jupiter pours forth the destinies of men;² the idea partly corresponding to the scriptural—"In the hand of the Lord there is a cup, and the wine is red; it is full mixed, and He poureth out of the same." But the title of the gods, nevertheless, both with Homer and Hesiod, is given not from the cup of sorrow, but of good: "givers of good" (δωτηρες εδων).—*Hes. Theog.* 664; *Odys.* viii. 325.

¹ [*Romeo and Juliet*, iii. 1.]

² [*Iliad*, xxiv. 527 seq.; *Psalms* lxxv. 8.]

are far-off sounds of a divine triumph, and a glory as of resurrection.*

§ 16. The Homeric temper is wholly different. Far more tender, more practical, more cheerful; bent chiefly on present things and giving victory now, and here, rather than in hope, and hereafter. The enemies of mankind, in Homer's conception, are more distinctly conquerable; they are ungoverned passions, especially anger, and unreasonable impulse generally (ἀρῇ). Hence the anger of Achilles, misdirected by pride, but rightly directed by friendship, is the subject of the *Iliad*. The anger of Ulysses (Ὀδυσσεύς, "the angry"¹), misdirected at first into idle and irregular hostilities, directed at last to execution of sternest justice, is the subject of the *Odyssey*.

Though this is the central idea of the two poems, it is connected with general display of the evil of all unbridled passions, pride, sensuality, indolence, or curiosity. The pride of Atrides, the passion of Paris, the sluggishness of Elpenor, the curiosity of Ulysses himself about the Cyclops, the impatience of his sailors in untying the winds, and all other faults or follies down to that—(evidently no small one in Homer's mind)—of domestic disorderliness, are throughout shown in contrast with conditions of patient affection and household peace.

Also, the wild powers and mysteries of Nature are in the Homeric mind among the enemies of man;² so that

* The Alcestis is perhaps the central example of the *idea* of all Greek drama.

¹ [Ruskin, it will be seen, makes Odysseus the "man of wrath" actively, not passively (for the alternatives, see the passage from Ruskin's MS. given in the note on p. 274; and for the other interpretation, see *The Queen of the Air*, § 16); thus accepting the mythic derivation of the name (from ὀδύσσομαι)—which Homer often makes Odysseus play upon—most plainly in *Odyssey*, xix. 407 :—

πολλοῖσιν γὰρ ἔγωγε ὀδυσσάμενος τόδ' ἱκάνω
ἀνδράσιν ἢ δὲ γυναιξὶν ἀνὰ χθόνα πουλυβοτείραν
τῷ δ' Ὀδυσσεὺς ὄνομ' ἔστω ἐπώνυμον.]

² [In the first draft of the chapter Ruskin proposed to enter more fully into various points in the *Odyssey*. Thus he added here :—

"... enemies of man; so that all whirlpools, desolate islands, and enchanted shades among which Ulysses meets with misfortune or delay are directly contrasted with the trim gardens and orderly palace of Alcinoüs (Strength with Prudence), where he finds at last effective help."]

all the labours of Ulysses are an expression of the contest of manhood, not only with its own passions or with the folly of others, but with the merciless and mysterious powers of the natural world.¹

§ 17. This is perhaps the chief signification of the seven years' stay with Calypso, "the concealer." Not, as vulgarly thought, the concealer of Ulysses, but the great concealer—the hidden power of natural things. She is the daughter of Atlas and the Sea (Atlas, the sustainer of heaven, and the Sea, the disturber of the Earth). She dwells in the island of Ogygia ("the ancient or venerable"). (Whenever Athens, or any other Greek city, is spoken of with any peculiar reverence, it is called "Ogygian."²) Escaping from this goddess of secrets, and from other spirits, some of destructive natural force (Scylla), others signifying the enchantment of mere natural beauty (Circe, daughter of the Sun and Sea), he arrives at last at the Phæacian land, whose king is "strength with intellect," and whose queen "virtue."³ These restore him to his country.

§ 18. Now observe that in their dealing with all these subjects the Greeks never shrink from horror; down to its uttermost depth, to its most appalling physical detail, they strive to sound the secrets of sorrow. For them there is no passing by on the other side, no turning away the eyes to vanity from pain. Literally, they have not "lifted up

¹ [Here again the MS. adds:—

"It may be well briefly to glance at the course of Ulysses in this light. His name may mean either the Augry or the Much-enduring: it has probably always the double sense in Homer's mind. His passionateness is never lost sight of, nor his power of restraining it—a slight provocation enrages him, but he always governs his rage. Yet three times in the *Odyssey* he loses to my mind all heroic character by this passionateness; first, when Eurylochus disobeys him; again, when he is taunted by Euryalus at the court of Alcinous; and last and chiefly, in the scene with Euryclea. His calamities begin in consequence of the wanton attack on the Cicones."

For the references, see *Odyssey*, x. 266; viii. 166 *seq.*; xix. 479 *seq.*; and ix. 40 *seq.*]

² [See, for instance, Æschylus, *Pers.* 37 and 974; and Sophocles, *Ed. Col.* 1770.]

³ [See *Odyssey*, book vii., for his reception by King Alcinous and Queen Arete. For another reference to the name of the Queen, and the significance of Phæacia generally, see *Munera Pulveris*, § 101. In the same book (§§ 93–94) is a fuller discussion of the meanings of Scylla and Circe.]

their souls unto vanity.”¹ Whether there be consolation for them or not, neither apathy nor blindness shall be their saviour; if, for them, thus knowing the facts of the grief of earth, any hope, relief, or triumph may hereafter seem possible,—well; but if not, still hopeless, reliefless, eternal, the sorrow shall be met face to face. This Hector, so righteous, so merciful, so brave, has, nevertheless, to look upon his dearest brother in miserablest death. His own soul passes away in hopeless sobs through the throat-wound of the Grecian spear. That is one aspect of things in this world, a fair world truly, but having, among its other aspects, this one, highly ambiguous.

§ 19. Meeting it boldly as they may, gazing right into the skeleton face of it, the ambiguity remains; nay, in some sort gains upon them. We trusted in the gods;—we thought that wisdom and courage would save us. Our wisdom and courage themselves deceive us to our death. Athena had the aspect of Deiphobus—terror of the enemy. She has not terrified him, but left us, in our mortal need.²

And beyond that mortality, what hope have we? Nothing is clear to us on that horizon, nor comforting. Funeral honours; perhaps also rest; perhaps a shadowy life—artless, joyless, loveless. No devices in that darkness of the grave,³ nor daring, nor delight. Neither marrying nor giving in marriage, nor casting of spears, nor rolling of chariots, nor voice of fame. Lapped in pale Elysian mist, chilling the forgetful heart and feeble frame, shall we waste on for ever? Can the dust of earth claim more of immortality than this? Or shall we have even so much as rest? May we, indeed, lie down again in the dust: or have not our sins hidden

¹ [Psalms xxiv. 4.]

² [See *Iliad*, xxii. 226 *seq.*, where Athena assumes the form of Hector's brother, Deiphobus, in order to encourage him to turn and meet Achilles. They join in mortal combat, Achilles unaffrighted. The spear thrown in vain by Hector is taken up by Athena and given to Achilles. Hector calls in vain upon Deiphobus for help, but no Deiphobus is there. It is by the Lance of Pallas that Hector goes bravely to death. In the first draft the title of the chapter is “The Spear of Deiphobus.”]

³ [See Ecclesiastes ix. 10; and for the next references Mark xii. 25 and Luke xix. 42.]

from us even the things that belong to that peace? May not chance and the whirl of passion govern us there: when there shall be no thought, nor work, nor wisdom, nor breathing of the soul?*

Be it so. With no better reward, no brighter hope, we will be men while we may: men, just, and strong, and fearless, and up to our power, perfect. Athena herself, our wisdom and our strength, may betray us:—Phœbus, our sun, smite us with plague, or hide his face from us helpless;—Jove and all the powers of fate oppress us, or give us up to destruction. While we live, we will hold fast our integrity; no weak tears shall blind us, no untimely tremors abate our strength of arm nor swiftness of limb. The gods have given us at least this glorious body and this righteous conscience; these will we keep bright and pure to the end. So may we fall to misery, but not to baseness; so may we sink to sleep, but not to shame.

§ 20. And herein was conquest. So defied, the betraying and accusing shadows shrank back; the mysterious horror subdued itself to majestic sorrow. Death was swallowed up in victory.¹ Their blood, which seemed to be poured out upon the ground, rose into hyacinthine flowers.² All the beauty of earth opened to them; they had ploughed into its darkness, and they reaped its gold; the gods, in whom they had trusted through all semblance of oppression, came down to love them and be their helpmates. All nature round them became divine,—one harmony of power and peace. The sun hurt them not by day, nor the moon by night;³ the earth opened no more her jaws into the pit:

* τῷ καὶ τεθνηῶτι νόον πόρε Περσεφόνηα,
οὐὲ πεπνῦσθαι τοὶ δὲ σκιάι αἰσσοῦσιν.

Od. x. 495.

¹ [1 Corinthians xv. 54.]

² [See *Queen of the Air*, § 83, where Ruskin refers to the hyacinth, fabled to have sprung from the blood of Hyacinthus, as connected with Greek thoughts of immortality.]

³ [See Psalms cxxi. 6.]

the sea whitened no more against them the teeth of his devouring waves. Sun, and moon, and earth, and sea,—all melted into grace and love; the fatal arrows rang not now at the shoulders of Apollo, the healer; lord of life, and of the three great spirits of life—Care, Memory, and Melody. Great Artemis guarded their flocks by night; Selene kissed in love the eyes of those who slept. And from all came the help of heaven to body and soul; a strange spirit lifting the lovely limbs; strange light glowing on the golden hair; and strangest comfort filling the trustful heart, so that they could put off their armour, and lie down to sleep,—their work well done, whether at the gates of their temples* or of their mountains; † accepting the death they once thought terrible, as the gift of Him who knew and granted what was best.¹

* οὐκέτι ἀνέστησαν, ἀλλ' ἐν τέλει τούτῳ ἔσχοντο. Herod. i. 31.

† ὁ δὲ ἀποπεμπόμενος αὐτὸς μὲν οὐκ ἀπελίπετο, τὸν δὲ παῖδα συντρατευόμενον ἔόντα οἱ μονογενεῖ ἀπέπεμψε. Herod. vii. 221.²

¹ [The first draft of § 20 is here given, as an example of how carefully Ruskin revised his work :—

“And herein was victory. So defied, the betraying and accusing shadows sank back; the deathful horror subdued itself into majestic sorrow. The grisly death was swallowed up in victory. All the beauty of earth opened upon them; as they had ploughed into its darkness, they reaped its gold; the gods in whom they had trusted came down to be their companions.* All nature round them seemed divine and one harmony of power and peace. The sun could not hurt them by day, nor the moon by night; the earth opened no more her mouth into the pit; the sea shook no more against them the teeth of his gnawing waves. Sun, and moon, and earth, and sea—all melted into grace and love; the fatal arrows rang no more at the shoulders of Apollo, the healer; lord of life, leader of the three great muses—Care, Memory, and Melody. Artemis, the huntress, watched their flocks by night; Selene kissed the eyes of all who slept. And from all came the help of heaven to body and soul; a strange spirit lifting the earthly limbs; strange light floating from the fiery crest; and strangest comfort filling the trustful heart of those who put off their armour, and lay down to rest—their work well done, by gates of their temples or their mountains, in worship or war; accepting the gift of death they once thought terrible, as the gift of Him who knew what was happiest for them.”

At the point marked * the same draft has this footnote: “Remember always in order to mark the reality of Greek belief, how Pisistratus was restored to the tyranny of Athens”—the reference being to the device of obtaining a woman of noble form to personate Athena and accompany Pisistratus to Athens (Herod. i. 60).]

² [The first of these instances is again a reference to the story of Cleobis and Bitō, victors in the games, of whom, moreover, the following tale is told: “It was

with the Argives a feast to Juno, and for all manner of cause it was needful that their mother should be carried to the temple by a yoke of oxen. But the oxen came not to them in time out of the field. Then the youths, pushed to extremity by the hour, stooping down under the yoke themselves, drew the chariot, and on the chariot their mother was carried by them. And traversing five-and-forty stadia, they reached the temple. And to them, having done this and been seen by all the solemn multitude, there came, thereupon, the noblest end of life, and the Goddess showed in this that it was better for man to die than to live. For the Argive men stood round and gave glory to the youths for their strength; and the Argive women gave glory to their mother for the children that she had received. But their mother, being full of great joy in the deed and in the fame, stood before the image, and prayed: 'To Cleobis and Bito, my sons, who have honoured thee greatly, do thou, oh Goddess, give what it is best should chance to men.' And after this her prayer, when the youths had sacrificed and feasted, they lay down to sleep in the temple itself, and rose no more but were held in that end. And the Argives made statues of them and gave them to the treasury at Delphi, as of noblest men." (Ruskin's translation, here copied from one of his notebooks; he refers to the story also in *A Joy for Ever*, §§ 199, 183, Vol. XVI. pp. 92, 167; and *Ethics of the Dust*, § 117.) The second reference is to Thermopylæ and the story of Megistias, the soothsayer, whom Leonidas endeavoured to dismiss that he might not perish with the rest; "but he would not himself depart, but sent away his son who was with him in the army, besides whom he had no other child."]

CHAPTER III

THE WINGS OF THE LION

§ 1. SUCH being the heroic spirit of Greek religion and art, we may now with ease trace the relations between it and that which animated the Italian, and chiefly the Venetian, schools.

Observe, all the nobleness, as well as the faults, of the Greek art were dependent on its making the most of this present life. It might do so in the Anacreontic temper—*Τί Πλειάδες σσι κἀμοί;*¹ “What have I to do with the Pleiads?” or in the defiant or the trustful endurance of fate;—but its dominion was in this world.

Florentine art was essentially Christian, ascetic, expectant of a better world, and antagonistic, therefore, to the Greek temper. So that the Greek element, once forced upon it, destroyed it. There was absolute incompatibility between them.² Florentine art, also, could not produce landscape. It despised the rock, the tree, the vital air itself, aspiring to breathe empyreal air.

Venetian art began with the same aim and under the same restrictions. Both are healthy in the youth of art. Heavenly aim and severe law for boyhood; earthly work and fair freedom for manhood.

§ 2. The Venetians began, I repeat, with asceticism;

¹ [See Anacreon's Ode to a Silver Cup; the reading, now generally accepted, is:—

*τί Πλειάδων μέλει μοι
τί δ' ἀστέρος Βούωτον;*

² [This was a view which Ruskin qualified when he came to study closely the work of Botticelli, of whom he said that he was pure “Greek in spirit” (*Ariadne Florentina*, § 159), and that he could “in a measure paint both Aphrodite and the Madonna” (*Fors Clavigera*, Letter 22).]

always, however, delighting in more massive and deep colour than other religious painters. They are especially fond of saints who have been cardinals, because of their red hats, and they sunburn all their hermits into splendid russet brown.

They differed from the Pisans in having no Maremma between them and the sea; from the Romans in continually quarrelling with the Pope; and from the Florentines in having no gardens.

They had another kind of garden, deep furrowed, with blossom in white wreaths—fruitless. Perpetual May therein, and singing of wild, nestless birds. And they had no Maremma to separate them from this garden of theirs. The destiny of Pisa was changed, in all probability, by the ten miles of marsh-land and poisonous air between it and the beach. The Genoese energy was feverish; too much heat reflected from their torrid Apennine. But the Venetian had his free horizon, his salt breeze, and sandy Lido-shore; sloped far and flat,—ridged sometimes under the Tramontane winds with half a mile's breadth of rollers;—sea and sand shrivelled up together in one yellow careering field of fall and roar.

§ 3. They were, also, we said, always quarrelling with the Pope.¹ Their religious liberty came, like their bodily health, from that wave training; for it is one notable effect of a life passed on ship-board to destroy weak beliefs in appointed forms of religion. A sailor may be grossly superstitious, but his superstitions will be connected with amulets and omens, not cast in systems. He must accustom himself, if he prays at all, to pray anywhere and anyhow. Candlesticks and incense not being portable into the maintop, he perceives those decorations to be, on the whole, inessential to a maintop mass. Sails must be set and cables bent, be it never so strict a saint's day, and it is found that no harm comes of it. Absolution on a lee-shore must be had of the breakers,

¹ [For the influence of this fact on Venetian architecture, see *Stones of Venice*, vol. i. (Vol. IX. pp. 25–29); and compare Vol. XVI. p. 463.]

it appears, if at all, and they give it plenary and brief, without listening to confession.¹

Whereupon our religious opinions become vague, but our religious confidences strong; and the end of it all is that we perceive the Pope to be on the other side of the Apennines, and able, indeed, to sell indulgences, but not winds, for any money. Whereas, God and the sea are with us, and we must even trust them both, and take what they shall send.

§ 4. Then, farther. This ocean-work is wholly adverse to any morbid conditions of sentiment. Reverie, above all things, is forbidden by Scylla and Charybdis. By the dogs and the depths, no dreaming! The first thing required of us is presence of mind. Neither love, nor poetry, nor piety, must ever so take up our thoughts as to make us slow or unready. In sweet Val d'Arno it is permissible enough to dream among the orange blossoms, and forget the day in twilight of ilex. But along the avenues of the Adrian waves there can be no careless walking. Vigilance, night and day, required of us, besides learning of many practical lessons in severe and humble dexterities. It is enough for the Florentine to know how to use his sword and to ride. We Venetians, also, must be able to use our swords, and on ground which is none of the steadiest; but, besides, we must be able to do nearly everything that hands can turn to—rudders, and yards, and cables, all needing workmanly handling and workmanly knowledge, from captain as well as from men. To drive a nail, lash a spar, reef a sail—rude work this for

¹ [The MS. adds a little Venetian picture:—

“For common sailors, it is true, there is a little chapel on the Riva, where, if we escape the sea, it will be right—as it has been ever since Horace’s time—to hang up a picture and light a taper; and we know that the wife is always there at sunset, and kneels long if there are high-heaped clouds in the west. Nevertheless our best devotion in not there nor in any other place in particular, but at oar or wheel, and under whatever stars are up at midnight or mid-morn—in no refined Latin utterance, but with a down-right meaning, and full belief that we shall be heard.”

For the reference to Horace, see *Odes*, i. 5, 13. The “little chapel on the Riva” may be the Church of S. Biagio, which contains the tombs of many sailors; or perhaps Ruskin referred rather to the little chapel of Our Lady which the gondoliers maintain at each *traghetto*.]

noble hands; but to be done sometimes, and done well on pain of death. All which not only takes mean pride out of us, and puts nobler pride of power in its stead; but it tends partly to soothe, partly to chasten, partly to employ and direct, the hot Italian temper, and make us every way greater, calmer, and happier.

§ 5. Moreover, it tends to induce in us great respect for the whole human body; for its limbs, as much as for its tongue or its wit. Policy and eloquence are well; and, indeed, we Venetians can be politic enough, and can speak melodiously when we choose; but to put the helm up at the right moment is the beginning of all cunning—and for that we need arm and eye;—not tongue. And with this respect for the body as such, comes also the sailor's preference of massive beauty in bodily form. The landsmen, among their roses and orange-blossoms, and chequered shadows of twisted vine, may well please themselves with pale faces, and finely drawn eyebrows, and fantastic braiding of hair. But from the sweeping glory of the sea we learn to love another kind of beauty; broad-breasted, level-browed, like the horizon;—thighed and shouldered like the billows; footed like their stealing foam;—bathed in cloud of golden hair like their sunsets.

§ 6. Such were the physical influences constantly in operation on the Venetians; their painters, however, were partly prepared for their work by others in their infancy. Associations connected with early life among mountains softened and deepened the teaching of the sea; and the wildness of form of the Tyrolese Alps gave greater strength and grotesqueness to their imaginations than the Greek painters could have found among the cliffs of the Ægean. Thus far, however, the influences on both are nearly similar. The Greek Sea was indeed less bleak, and the Greek hills were less grand; but the difference was in degree rather than in the nature of their power. The moral influences at work on the two races were far more sharply opposed.

§ 7. Evil, as we saw, had been fronted by the Greek, and thrust out of his path. Once conquered, if he thought of it more, it was involuntarily, as we remember a painful dream, yet with a secret dread that the dream might return and continue for ever. But the teaching of the Church in the Middle Ages had made the contemplation of evil one of the duties of men. As sin, it was to be duly thought upon, that it might be confessed. As suffering, endured joyfully, in hope of future reward. Hence conditions of bodily distemper which an Athenian would have looked upon with the severest contempt and aversion, were in the Christian Church regarded always with pity, and often with respect: while the partial practice of celibacy by the clergy, and by those over whom they had influence,—together with the whole system of conventual penance and pathetic ritual (with the vicious reactionary tendencies necessarily following), introduced calamitous conditions both of body and soul, which added largely to the pagan's simple list of elements of evil, and introduced the most complicated states of mental suffering and decrepitude.

§ 8. Therefore the Christian painters differed from the Greek in two main points. They had been taught a faith which put an end to restless questioning and discouragement. All was at last to be well—and their best genius might be peacefully given to imagining the glories of heaven and the happiness of its redeemed. But on the other hand, though suffering was to cease in heaven, it was to be not only endured, but honoured upon earth. And from the Crucifixion, down to a beggar's lameness, all the tortures and maladies of men were to be made, at least in part, the subjects of art. The Venetian was, therefore, in his inner mind, less serious than the Greek: in his superficial temper, sadder. In his heart there was none of the deep horror which vexed the soul of Æschylus or Homer. His Pallas-shield was the shield of Faith, not the shield of the Gorgon. All was at last to issue happily; in sweetest harpings and seven-fold circles of light. But

for the present he had to dwell with the maimed and the blind, and to revere Lazarus more than Achilles.

§ 9. This reference to a future world has a morbid influence on all their conclusions. For the earth and all its natural elements are despised. They are to pass away like a scroll.¹ Man, the immortal, is alone revered; his work and presence are all that can be noble or desirable. Men, and fair architecture, temples and courts such as may be in a celestial city, or the clouds and angels of Paradise; these are what we must paint when we want beautiful things. But the sea, the mountains, the forests, are all adverse to us,—a desolation. The ground that was cursed for our sake;²—the sea that executed judgment on all our race, and rages against us still, though bridled; storm-demons churning it into foam in nightly glare on Lido, and hissing from it against our palaces. Nature is but a terror, or a temptation. She is for hermits, martyrs, murderers,—for St. Jerome, and St. Mary of Egypt, and the Magdalen in the desert, and monk Peter, falling before the sword.³

§ 10. But the worst point we have to note respecting the spirit of Venetian landscape is its pride.

It was observed in the course of the third volume⁴ how the mediæval temper had rejected agricultural pursuits, and whatever pleasures could come of them.

At Venice this negation had reached its extreme. Though the Florentines and Romans had no delight in farming, they had in gardening. The Venetian possessed, and cared for, neither fields nor pastures. Being delivered, to his loss, from all the wholesome labours of tillage, he was also shut out from the sweet wonders and charities of

¹ [Revelation vi. 14.]

² [See Genesis iii. 17.]

³ [To a picture by Bellini of this latter subject (now in the National Gallery, No. 812) Ruskin often refers: see, for instance, *Aratra Pentelici*, § 221. For the landscape in Titian's "St. Jerome," see Vol. III. pp. 181-182; Vol. IV. pp. 244, 246; Vol. VI. p. 432. For landscapes by Tintoret, called "St. Mary of Egypt" and "The Magdalen," see *Stones of Venice*, vol. iii. (Vol. XI. pp. 408-409).]

⁴ [See Vol. V. pp. 248 seq.]

the earth, and from the pleasant natural history of the year. Birds and beasts, and times and seasons, all unknown to him. No swallow chattered at his window,* nor, nested under his golden roofs, claimed the sacredness of his mercy;† no Pythagorean fowl taught him the blessings of the poor,‡ nor did the grave spirit of poverty rise at his side to set forth the delicate grace and honour of lowly life.§ No humble thoughts of grasshopper sire had he, like the Athenian; no gratitude for gifts of olive; no childish care for figs, any more than thistles. The rich Venetian feast had no need of the fig-tree spoon.¶ Dramas about birds, and wasps and frogs, would have passed unheeded by his proud fancy; carol or murmur of them had fallen unrecognized on ears accustomed only to grave syllables of war-tried men, and wash of songless wave.

§ 11. No simple joy was possible to him. Only stateliness and power; high intercourse with kingly and beautiful humanity, proud thoughts, or splendid pleasures; throned

* Anacreon, Ode 12th.

† Herod. i. 159.¹

‡ Lucian (Micyllus).

§ Aristophanes, *Plutus*.

¶ *Hippias Major*, 290 D.

¹ ["Aristodicus went all round the temple destroying the nests of the sparrows and of all the other kinds of birds which had been hatched on the temple; and while he was doing this, it is said that a voice came from the inner shrine to Aristodicus and spake thus: 'Thou most impious of men, why dost thou dare to do this? Dost thou carry away by force from my temple the suppliants for my protection?'"] Micyllus (a cobbler) is the hero of Lucian's dialogue "The Dream or The Cock"—or, as it is sometimes called in English versions, "The Cock and the Cobbler"—and is instructed by his philosophic feathered friend to entertain a contempt for plutocrats. (For another reference to the dialogue, see below, p. 401.) For Ruskin's reading of the *Plutus*, see above, Introduction, p. lxii. In his analysis of the play, there mentioned, Ruskin describes how "Penia finely describes herself as the Goddess of Poverty, as Bacchus of drunkenness," and how excellent are her arguments. For the Athenian's "thoughts of grasshopper sire," see Aristophanes, *Clouds*, 984, and Thucydides, i. 6: "Quite recently the old-fashioned refinement of dress still lingered among the elder men of their richer class, who wore under-garments of linen, and bound back their hair in a knot with golden clasps in the form of grasshoppers; and the same customs long survived among the elders of Ionia, having been derived from their Athenian ancestors." Ruskin discusses in the *Queen of the Air*, § 38, the symbolism of the olive in the myth of its gift to Athens by Athena. The Athenian "care for figs" is familiar from the old explanation of the word *σχοφάρτης* (a common informer), as one who informed against persons exporting figs, or plundering sacred fig-trees (see Hume's essay on the Balance of Trade). In the *Hippias Major* (290 D.) Socrates asks whether for a dish full of porridge a fig-tree spoon is not more appropriate than one of gold.]

sensualities, and ennobled appetites. But of innocent, childish, helpful, holy pleasures, he had none. As in the classical landscape, nearly all rural labour is banished from the Titianesque: there is one bold etching of a landscape, with grand ploughing in the foreground,¹ but this is only a caprice; the customary Venetian background is without sign of laborious rural life. We find, indeed, often a shepherd with his flock, sometimes a woman spinning, but no division of fields, no growing crops, nor nestling villages. In the numerous drawings and woodcuts variously connected with or representative of Venetian work, a watermill is a frequent object, a river constant, generally the sea. But the prevailing idea in all the great pictures I have seen is that of mountainous land with wild but graceful forest, and rolling or horizontal clouds. The mountains are dark blue; the clouds glowing or soft gray, always massive; the light, deep, clear, melancholy; the foliage, neither intricate nor graceful, but compact and sweeping (with undulated trunks), dividing much into horizontal flakes, like the clouds; the ground rocky and broken somewhat monotonously, but richly green with wild herbage; here and there a flower, by preference white or blue, rarely yellow, still more rarely red.

§ 12. It was stated² that this heroic landscape of theirs was peopled by spiritual beings of the highest order. And in this rested the dominion of the Venetians over all later schools. They were the *last believing* school of Italy. Although, as I said above, always quarrelling with the Pope, there is all the more evidence of an earnest faith in their religion. People who trusted the Madonna less, flattered the Pope more. But down to Tintoret's time, the Roman Catholic religion was still real and sincere at Venice; and though faith in it was compatible with much

¹ [Ruskin had a print of this subject (now in Mr. Allen's possession); it is engraved by Dominique Vivant Denon (1747-1825), a distinguished amateur engraver and director of the Imperial Galleries under Napoleon I. Some other Plates of farm-scenes are given in Lefebvre's book of etchings; and see p. 60 in J. Gilbert's *Cadore, or Titian's Country*.]

² [See above, p. 254.]

which to us appears criminal or absurd, the religion itself was entirely sincere.

§ 13. Perhaps when you see one of Titian's splendidly passionate subjects, or find Veronese making the Marriage in Cana one blaze of worldly pomp, you imagine that Titian must have been a sensualist, and Veronese an unbeliever.

Put the idea from you at once, and be assured of this for ever: it will guide you through many a labyrinth of life, as well as of painting,—that of an evil tree, men never gather good fruit¹—good of any sort or kind; even good sensualism.²

Let us look to this calmly. We have seen what physical advantage the Venetian had, in his sea and sky: also what moral disadvantage he had, in scorn of the poor; now finally, let us see with what power he was invested, which men since his time have never recovered more.

§ 14. "Neither of a bramble bush gather they grapes."³

The great saying has twofold help for us. Be assured, first, that if it were bramble from which you gathered them, these are not grapes in your hand, though they look like grapes. Or if these are indeed grapes, it was no bramble you gathered them from, though it looked like one.

It is difficult for persons, accustomed to receive, without questioning, the modern English idea of religion, to understand the temper of the Venetian Catholics. I do not enter into examination of our own feelings; but I have to note this one significant point of difference between us.

§ 15. An English gentleman, desiring his portrait, gives probably to the painter a choice of several actions, in any of which he is willing to be represented. As for instance, riding his best horse, shooting with his favourite pointer,

¹ [See Matthew vii. 18.]

² [In the MS. Ruskin had added here:—

"And this being a great and wonderful fact, and the one which of all that I have had to show in this work, is principal, we will pause here and approach it seriously. We have seen what physical . . ."

The passage is of interest, for seventeen years later, in his Oxford course entitled "*Readings in Modern Painters*" (see a later volume), Ruskin spoke of his "main subject" in that book being "that all art depended on nobleness of life."

³ [Luke vi. 44.]

manifesting himself in his robes of state on some great public occasion, meditating in his study, playing with his children, or visiting his tenants; in any of these or other such circumstances, he will give the artist free leave to paint him. But in one important action he would shrink even from the suggestion of being drawn. He will assuredly not let himself be painted praying.

Strangely, this is the action which, of all others, a Venetian desires to be painted in. If they want a noble and complete portrait, they nearly all choose to be painted on their knees.¹

§ 16. "Hypocrisy," you say; and "that they might be seen of men."² If we examine ourselves, or any one else, who will give trustworthy answer on this point, so as to ascertain, to the best of our judgment, what the feeling *is*, which would make a modern English person dislike to be painted praying, we shall not find it, I believe, to be excess of sincerity. Whatever we find it to be, the opposite Venetian feeling is certainly not hypocrisy. It is often conventionalism, implying as little devotion in the person represented, as regular attendance at church does with us. But that it is not hypocrisy, you may ascertain by one simple consideration (supposing you not to have enough knowledge of the expression of sincere persons to judge by the portraits themselves). The Venetians, when they desired to deceive, were much too subtle to attempt it clumsily. If they assumed the mask of religion, the mask must have been of some use. The persons whom it deceived must, therefore, have been religious, and, being so, have believed in the Venetians' sincerity. If, therefore, among other contemporary nations with whom they had intercourse, we can find any, more religious than they, who were duped, or even influenced, by their external religiousness, we might have some ground for suspecting that religiousness to be assumed. But if we can find no one likely to have been

¹ [With this passage compare the one from the MS. of the second volume cited at Vol. IV. p. 189 n.]

² [Matthew vi. 1.]

deceived, we must believe the Venetian to have been, in reality, what there was no advantage in seeming.

§ 17. I leave the matter to your examination, forewarning you, confidently, that you will discover by severest evidence, that the Venetian religion was true. Not only true, but one of the main motives of their lives. In the field of investigation to which we are here limited, I will collect some of the evidence of this.

For one profane picture by great Venetians, you will find ten of sacred subjects; and those, also, including their grandest, most laboured, and most beloved works. Tintoret's power culminates in two great religious pictures: the Crucifixion, and the Paradise. Titian's in the Assumption, the Peter Martyr, and Presentation of the Virgin. Veronese's in the Marriage in Cana. John Bellini and Basaiti never, so far as I remember, painted any other than sacred subjects.¹ By the Palmas, Vincenzo Catena, and Bonifazio, I remember no profane subject of importance.

§ 18. There is, moreover, one distinction of the very highest import between the treatment of sacred subjects by Venetian painters and by all others.

Throughout the rest of Italy, piety had become abstract, and opposed theoretically to worldly life; hence the Florentine and Umbrian painters generally separated their saints from living men. They delighted in imagining scenes of spiritual perfectness;—Paradises, and companies of the redeemed at the judgment;—glorified meetings of martyrs;—madonnas surrounded by circles of angels. If, which was rare, definite portraitures of living men were introduced,

¹ [For Tintoret's "Crucifixion," see above, p. 258; and for the "Paradise," below, p. 298, and *Stones of Venice*, vol. iii. (Vol. XI. p. 372). For Titian's "Assumption," see below, p. 298, and Vol. XI. p. 361; but Ruskin's opinion of the picture changed in later years (see *Guide to the Venetian Academy*); for the (now destroyed) "Peter Martyr," see Vol. III. p. 28; and for the "Presentation," see *Guide to the Venetian Academy*. For Veronese's "Marriage in Cana," see above, p. 287, and General Index. Ruskin of course excludes portraits from his purview here, but he forgets Bellini's "Bacchanal" at Alnwick; for the same painter's series of classical allegories at Venice, see again *Guide to the Venetian Academy*. For other references to Basaiti, see Vol. III. p. 179; Vol. XI. p. 361. For Bonifazio, Vol. V. p. 401; Vol. XI. pp. xxviii., 179, 387, 390, 399; Vol. XIII. p. 35. For Catena, Vol. XI. p. 392.]

these real characters formed a kind of chorus or attendant company, taking no part in the action. At Venice all this was reversed, and so boldly as at first to shock, with its seeming irreverence, a spectator accustomed to the formalities and abstractions of the so-called sacred schools. The *maçonnas* are no more seated apart on their thrones, the saints no more breathe celestial air. They are on our own plain ground—nay, here in our houses with us. All kind of worldly business going on in their presence, fearlessly; our own friends and respected acquaintances, with all their mortal faults, and in their mortal flesh, looking at them face to face unalarmed: nay, our dearest children playing with their pet dogs at Christ's very feet.

I once myself thought this irreverent. How foolishly! As if children whom He loved *could* play anywhere else.

§ 19. The picture most illustrative of this feeling is perhaps that at Dresden, of Veronese's family, painted by himself.¹

He wishes to represent them as happy and honoured. The best happiness and highest honour he can imagine for them is that they should be presented to the Madonna, to whom, therefore, they are being brought by the three virtues—Faith, Hope, and Charity.

The Virgin stands in a recess behind two marble shafts, such as may be seen in any house belonging to an old family in Venice. She places the boy Christ on the edge of a balustrade before her. At her side are St. John the Baptist, and St. Jerome. This group occupies the left side of the picture. The pillars, seen sideways, divide it from

¹ [This picture is now more commonly described as the "Madonna and Child, with the Cuccina Family." This family, which came originally from Bergamo, was in the sixteenth century one of the richest in Venice. In 1645, Francis I., Duke of Modena, purchased the picture from the Cuccina family; Anton Maria Cuccina, with whom the negotiations were contained, mentions in a letter that he especially valued the picture on account of the portraits of his ancestors which it contained. In the Modena Inventory of 1743 the picture appears, however, as the "Family of P. Veronese," and as such it came to the Dresden Gallery. Its former title has, however, now been restored to it. For other references to it, see below, p. 330; and Vol. XVI. p. 470. The Plate here given is reproduced from Ruskin's copy of a portion of the picture (see above, p. 1.); a reproduction of the whole picture may be seen in *Paolo Veronese* ("Newnes' Art Library").]

From "The Old Maid"

A Family Group

the group formed by the Virtues, with the wife and children of Veronese. He himself stands a little behind, his hands clasped in prayer.

§ 20. His wife kneels full in front, a strong Venetian woman, well advanced in years. She has brought up her children in fear of God, and is not afraid to meet the Virgin's eyes. She gazes steadfastly on them; her proud head and gentle, self-possessed face are relieved in one broad mass of shadow against a space of light, formed by the white robes of Faith, who stands beside her—guardian, and companion. Perhaps a somewhat disappointing Faith at the first sight, for her face is not in any special way exalted or refined. Veronese knew that Faith had to companion simple and slow-hearted people, perhaps oftener than able or refined people—does not therefore insist on her being severely intellectual, or looking as if she were always in the best company. So she is only distinguished by her pure white (not bright white) dress, her delicate hand, her golden hair drifted in light ripples across her breast, from which the white robes fall nearly in the shape of a shield—the shield of Faith. A little behind her stands Hope; she also, at first, not to most people a recognizable Hope. We usually paint Hope as young, and joyous. Veronese knows better. The young hope is vain hope—passing away in rain of tears; but the Hope of Veronese is aged, assured, remaining when all else has been taken away. “For tribulation worketh patience, and patience experience, and experience hope”; and *that* hope maketh not ashamed.¹

She has a black veil on her head.

Then again, in the front, is Charity, red-robed; stout in the arms,—a servant of all work, she; but small-headed, not being specially given to thinking; soft-eyed, her hair braided brightly; her lips rich red, sweet-blossoming. She has got some work to do even now, for a nephew of Veronese's is doubtful about coming forward, and looks very humbly and penitently towards the Virgin—his life

¹ [Romans v. 3, 5.]

perhaps not having been quite so exemplary as might at present be wished. Faith reaches her small white hand lightly back to him, lays the tips of her fingers on his; but Charity takes firm hold of him by the wrist from behind, and will push him on presently, if he still hangs back.

§ 21. In front of the mother kneel her two eldest children, a girl of about sixteen, and a boy a year or two younger. They are both rapt in adoration—the boy's being the deepest. Nearer us, at their left side, is a younger boy, about nine years old—a black-eyed fellow, full of life—and evidently his father's darling (for Veronese has put him full in light in the front; and given him a beautiful white silken jacket, barred with black, that nobody may ever miss seeing him to the end of time). He is a little shy about being presented to the Madonna, and for the present has got behind the pillar, blushing, but opening his black eyes wide; he is just summoning courage to peep round and see if she looks kind. A still younger child, about six years old, is really frightened, and has run back to his mother, catching hold of her dress at the waist. She throws her right arm round him and over him, with exquisite instinctive action, not moving her eyes from the Madonna's face. Last of all, the youngest child, perhaps about three years old, is neither frightened nor interested, but finds the ceremony tedious, and is trying to coax the dog to play with him; but the dog, which is one of the little curly, short-nosed, fringy-pawed things, which all Venetian ladies petted, will not now be coaxed. For the dog is the last link in the chain of lowering feeling, and takes his doggish views of the matter. He cannot understand, first, how the Madonna got into the house; nor, secondly, why she is allowed to stay, disturbing the family, and taking all their attention from his dogship. And he is walking away, much offended.

§ 22. The dog is thus constantly introduced by the Venetians in order to give the fullest contrast to the highest tones of human thought and feeling. I shall examine this point presently farther, in speaking of pastoral landscape

and animal painting ;¹ but at present we will merely compare the use of the same mode of expression in Veronese's Presentation of the Queen of Sheba.²

§ 23. This picture is at Turin, and is of quite inestimable value. It is hung high ; and the really principal figure the Solomon, being in the shade, can hardly be seen, but is painted with Veronese's utmost tenderness, in the bloom of perfect youth, his hair golden, short, crisply curled. He is seated high on his lion throne : two elders on each side beneath him, the whole group forming a tower of solemn shade. I have alluded, elsewhere, to the principle on which all the best composers act, of supporting these lofty groups by some vigorous mass of foundation.³ This column of noble shade is curiously sustained. A falconer leans forward from the left-hand side, bearing on his wrist a snow-white falcon, its wings spread, and brilliantly relieved against the purple robe of one of the elders. It touches with its wings one of the golden lions of the throne, on which the light also flashes strongly ; thus forming, together with it, the lion and eagle symbol, which is the type of Christ throughout mediæval work. In order to show the meaning of this symbol, and that Solomon is typically invested with the Christian royalty, one of the elders, by a bold anachronism, holds a jewel in his hand in the shape of a cross, with which he (by accident of gesture) points to Solomon ; his other hand is laid on an open book.⁴

§ 24. The group opposite, of which the Queen forms the centre, is also painted with Veronese's highest skill ; but contains no point of interest bearing on our present subject, except its connection by a chain of descending emotion. The Queen is wholly oppressed and subdued ; kneeling, and

¹ [See below, pp. 334 *seq.* ; and compare Ruskin's remarks on a picture by Carpaccio of "Venetian ladies and their pets," in *St. Mark's Rest*, § 202.]

² [This picture is reproduced as Plate III. in Vol. XVI. : see pp. xxxvii. *seq.*, 185 there for other descriptions of it.]

³ [See *Elements of Drawing*, § 220 (Vol. XV. p. 190) ; and compare Vol. XIII. pp. 423-424.]

⁴ [For this "anachronism," see again Vol. XVI. p. xxxix.]

nearly fainting, she looks up to Solomon with tears in her eyes; he, startled by fear for her, stoops forward from the throne, opening his right hand, as if to support her, so as almost to drop the sceptre. At her side her first maid of honour is kneeling also, but does not care about Solomon; and is gathering up her dress that it may not be crushed; and looking back to encourage a negro-girl, who, carrying two toy-birds, made of enamel and jewels, for presentation to the King, is frightened at seeing her Queen fainting, and does not know what she ought to do; while, lastly, the Queen's dog, another of the little fringy-paws, is wholly unabashed by Solomon's presence, or anybody else's; and stands with his forelegs well apart, right in front of his mistress, thinking everybody has lost their wits; and barking violently at one of the attendants, who has set down a golden vase disrespectfully near him.

§ 25. Throughout these designs I want the reader to notice the purpose of representing things as they were likely to have occurred, down to trivial, or even ludicrous detail—the nobleness of all that was intended to be noble being so great that nothing could detract from it. A farther instance, however, and a prettier one, of this familiar realization, occurs in a *Holy Family*, by Veronese, at Brussels.¹ The Madonna has laid the infant Christ on a projecting base of pillar, and stands behind, looking down on Him. St. Catherine, having knelt down in front, the child turns round to receive her—so suddenly, and so far, that any other child must have fallen over the edge of the stone. St. Catherine, terrified, thinking He is really going to fall, stretches out her arms to catch Him. But the Madonna, looking down, only smiles, “He will not fall.”

§ 26. A more touching instance of this realization occurs, however, in the treatment of the Saint Veronica (in the Ascent to Calvary), at Dresden.² Most painters merely

¹ [In the Palais des Beaux Arts.]

² [There is a reproduction of this picture at p. 54 of *Paolo Veronese* (in “Newnes Art Library”).]

represent her as one of the gentle, weeping, attendant women; and show her giving the handkerchief as though these women had been allowed to approach Christ without any difficulty. But in Veronese's conception, she has to break through the executioners to Him. She is not weeping; and the expression of pity, though intense, is overborne by that of resolution. She is determined to reach Christ; has set her teeth close, and thrusts aside one of the executioners, who strikes fiercely at her with a heavy doubled cord.

§ 27. These instances are enough to explain the general character of the mind of Veronese, capable of tragic power to the utmost, if he chooses to exert it in that direction, but, by habitual preference, exquisitely graceful and playful; religious, without severity, and winningly noble; delighting in slight, sweet, every-day incident, but hiding deep meanings underneath it; rarely painting a gloomy subject, and never a base one.

§ 28. I have, in other places, entered enough into the examination of the great religious mind of Tintoret;¹ supposing then, that he was distinguished from Titian chiefly by this character. But in this I was mistaken;—the religion of Titian is like that of Shakspeare—occult behind his magnificent equity. It is not possible, however, within the limits of this work, to give any just account of the mind of 'Titian':² nor shall I attempt it; but will only explain some of those more strange and apparently inconsistent attributes of it, which might otherwise prevent the reader from getting clue to its real tone. The first of these is its occasional coarseness in choice of type of feature.

§ 29. In the second volume I had to speak of Titian's Magdalen, in the Pitti Palace, as treated basely, and that in strong terms, "the disgusting Magdalen of the Pitti."³

Truly she is so, as compared with the received types

¹ [See *Modern Painters*, vol. ii. (Vol. IV. pp. 270 *seq.*), and *Stones of Venice*, vol. iii. (Vol. XI. pp. 403 *seq.*).]

² [Compare what Ruskin says in the Preface, above, p. 6.]

³ [In this edition, see Vol. IV. p. 195; and compare below, p. 440 n.]

of the Magdalen. A stout, red-faced woman, dull, and coarse of feature, with much of the animal in even her expression of repentance—her eyes strained, and inflamed with weeping. I ought, however, to have remembered another picture of the Magdalen by Titian (Mr. Rogers's, now in the National Gallery¹), in which she is just as refined, as in the Pitti Palace she is gross; and had I done so, I should have seen Titian's meaning. It had been the fashion before his time to make the Magdalen always young and beautiful; her, if no one else, even the rudest painters flattered; her repentance was not thought perfect unless she had lustrous hair and lovely lips. Titian first dared to doubt the romantic fable, and reject the narrowness of sentimental faith. He saw that it was possible for plain women to love no less vividly than beautiful ones; and for stout persons to repent, as well as those more delicately made. It seemed to him that the Magdalen would have received her pardon not the less quickly because her wit was none of the readiest; and would not have been regarded with less compassion by her Master because her eyes were swollen, or her dress disordered. It is just because he has set himself sternly to enforce this lesson that the picture is so painful: the only instance, so far as I remember, of Titian's painting a woman markedly and entirely belonging to the lowest class.

§ 30. It may perhaps appear more difficult to account for the alternation of Titian's great religious pictures with others devoted wholly to the expression of sensual qualities, or to exulting and bright representation of heathen deities.

The Venetian mind, we have said, and Titian's especially, as the central type of it, was wholly realist, universal, and manly.

In this breadth and realism, the painter saw that sensual passion in man was, not only a fact, but a Divine fact; the human creature, though the highest of the animals, was,

¹ [No. 270. For another reference to the picture, see *Seven Lamps* (Vol. VIII. p. 124).]

nevertheless, a perfect animal, and his happiness, health, and nobleness, depended on the due power of every animal passion, as well as the cultivation of every spiritual tendency.

He thought that every feeling of the mind and heart, as well as every form of the body, deserved painting. Also to a painter's true and highly trained instinct, the human body is the loveliest of all objects. I do not stay to trace the reasons why, at Venice, the female body could be found in more perfect beauty than the male; but so it was, and it becomes the principal subject, therefore, both with Giorgione and Titian. They painted it fearlessly, with all right and natural qualities; never, however, representing it as exercising any overpowering attractive influence on man; but only on the Faun or Satyr.

Yet they did this so majestically that I am perfectly certain no untouched Venetian picture ever yet excited one base thought (otherwise than in base persons anything may do so);¹ while in the greatest studies of the female body by the Venetians, all other characters are overborne by majesty, and the form becomes as pure as that of a Greek statue.²

§ 31. There is no need, I should think, to point out how this contemplation of the entire personal nature was reconcilable with the severest conceptions of religious duty and faith.

But the fond introduction of heathen gods may appear less explicable.

On examination, however, it will be found, that these

¹ [The MS. adds :—

“There is more real power for harm in many a modern drawing-room print than in Titian's Faun and Nymph in the Dresden Gallery, or his recumbent Nymph with the Satyr unveiling her, of the Louvre.”

The former picture is presumably the “Venus and Adonis”; the latter is the “Jupiter and Antiope,” known as “The Venus del Pardo.”]

² [The MS. adds here :—

“In the engravings by Zanetti of the remnants of fresco by the great Venetian masters then existing (1760), Giorgione's treatment of the upright female figure in the niche (the third plate), allowing for the deficiency of engraving, may be considered I think as characteristically Venetian.”

This is the figure engraved as Plate 79 opposite p. 409, below; for a note on Zanetti's work, see p. 439 n.]

deities are never painted with any heart-reverence or affection. They are introduced for the most part symbolically (Bacchus and Venus oftenest, as incarnations of the spirit of revelry and beauty), of course always conceived with deep imaginative truth, much resembling the mode of Keats's conception; but never so as to withdraw any of the deep devotion rendered to the objects of Christian faith.

In all its roots of power, and modes of work;—in its belief, its breadth, and its judgment, I find the Venetian mind perfect.

How, then, did its art so swiftly pass away? How become, what it became unquestionably, one of the chief causes of the corruption of the mind of Italy, and of her subsequent decline in moral and political power?

§ 32. By reason of one great, one fatal fault;—recklessness in aim. Wholly noble in its sources, it was wholly unworthy in its purposes.

Separate and strong, like Samson, chosen from its youth,¹ and with the spirit of God visibly resting on it,—like him, it warred in careless strength, and wantoned in untimely pleasure. No Venetian painter ever worked with any aim beyond that of delighting the eye, or expressing fancies agreeable to himself or flattering to his nation. They could not be either, unless they were religious. But he did not desire the religion. He desired the delight.

The Assumption² is a noble picture, because Titian believed in the Madonna. But he did not paint it to make any one else believe in her. He painted it, because he enjoyed rich masses of red and blue, and faces flushed with sunlight.

Tintoret's Paradise is a noble picture, because he believed in Paradise. But he did not paint it to make any one think of heaven; but to form a beautiful termination for the hall of the Greater Council.

¹ [Judges xiii.; Numbers xi. 25, 26.]

² [For the "Assumption" of Titian and the "Paradise" of Tintoret, see above, p. 289 n.]

Other men used their effete faiths and mean faculties with a high moral purpose. The Venetian gave the most earnest faith, and the lordliest faculty, to gild the shadows of an antechamber, or heighten the splendours of a holiday.

§ 33. Strange and lamentable as this carelessness may appear, I find it to be almost the law with the great workers. Weak and vain men have acute consciences, and labour under a profound sense of responsibility. The strong men, sternly disdainful of themselves, do what they can, too often merely as it pleases them at the moment, reckless what comes of it.

I know not how far in humility, or how far in bitter and hopeless levity, the great Venetians gave their art to be blasted by the sea-winds or wasted by the worm. I know not whether in sorrowful obedience, or in wanton compliance, they fostered the folly, and enriched the luxury of their age. This only I know, that in proportion to the greatness of their power was the shame of its desecration and the suddenness of its fall. The enchanter's spell, woven by centuries of toil, was broken in the weakness of a moment; and swiftly, and utterly, as a rainbow vanishes, the radiance and the strength faded from the wings of the Lion.

CHAPTER IV

DÜRER AND SALVATOR

“EMIGRAVIT”¹

§ 1. By referring to the first analysis of our subject,² it will be seen we have next to examine the art which cannot conquer the evil, but remains at war with, or in captivity to it.

Up to the time of the Reformation, it was possible for men even of the highest powers of intellect, to obtain a tranquillity of faith, in the highest degree favourable to the pursuit of any particular art. Possible, at least, we see it to have been; there is no need—nor, so far as I see, any ground for argument about it. I am myself unable to understand how it was so, but the fact is unquestionable. It is not that I wonder at men’s trust in the Pope’s infallibility, or in his virtue; nor at their surrendering their private judgment; nor at their being easily cheated by imitations of miracles; nor at their thinking indulgences could be purchased with money. But I wonder at this one thing only; the acceptance of the doctrine of eternal punishment as dependent on accident of birth, or momentary excitement of devotional feeling. I marvel at the acceptance of the system (as stated in its fulness by Dante³)

¹ [From the inscription on Dürer’s tomb in the Churchyard of St. John at Nuremberg—“*Quicquid Alberti Dureri mortale fuit, sub hoc conditur tumulo. Emigravit viii. idus Aprilis, mxxxviii*”; the sentiment is thus versified by Longfellow:—

“*Emigravit* is the inscription on the tombstone where he lies;
Dead he is not, but departed,—for the artist never dies.”

(“Nuremberg” in *The Belfry of Bruges and other Poems* (1845).]

² [See above, ch. ii. § 13, p. 271.]

³ [No doubt Ruskin had in mind the passage at beginning of *Purg.* vii., where Virgil says: “For no other fault have I lost heaven than for not having had faith” (vv. 7-8); and again: “My place is in Limbo, with those who clothed themselves not

which condemned guiltless persons to the loss of heaven because they had lived before Christ, and which made the obtaining of Paradise turn frequently on a passing thought or a momentary invocation.¹ How this came to pass, it is no part of our work here to determine. That in this faith, it was possible to attain entire peace of mind, to live calmly, and die hopefully, is indisputable.

§ 2. But this possibility ceased at the Reformation. Thenceforward human life became a school of debate, troubled and fearful. Fifteen hundred years of spiritual teaching were called into fearful question, whether indeed it had been teaching by angels or devils? Whatever it had been, there was no longer any way of trusting it peacefully.

A dark time for all men. We cannot now conceive it. The great horror of it lay in this:—that, as in the trial-hour of the Greek,² the heavens themselves seemed to have deceived those who had trusted in them.

“We had prayed with tears; we had loved with our hearts. There was no choice of way open to us. No guidance, from God or man, other than this, and behold, it was a lie. ‘When He, the Spirit of Truth, is come, He shall guide you into all truth.’³ And he has guided us into *no* truth. There can be no such Spirit. There is no Advocate, no Comforter. Has there been no Resurrection?”

§ 3. Then came the Resurrection of Death. Never since man first saw him face to face, had his terror been so great. “Swallowed up in victory”:⁴ alas! no; but

in the three holy virtues [faith, hope, and charity], and yet, without sin, knew and practised all the others” (vv. 34–36). (*cf.* what Virgil says of Limbo to Dante in *Inf.* iv.: “The spirits here did not sin; and if they have merit, this suffices not, inasmuch as they received not baptism . . . and if they lived before Christianity they did not worship God aright . . . for such defect, not for any sin beside, are we lost” (vv. 34–41).]

¹ [The most typical instances are those of Buonconte da Montefeltro (*Purg.* v. 100–107) and Manfred (*Purg.* iii. 118–123).]

² [See above, ch. iii. § 19.]

³ [John xvi. 13.]

⁴ [1 Corinthians xv. 54.]

king over all the earth. All faith, hope, and fond belief were betrayed. Nothing of futurity was now sure but the grave.

For the Pan-Athenaic Triumph, and the Feast of Jubilee, there came up, through fields of spring, the Dance of Death.

The brood of weak men fled from the face of him. A new Bacchus and his crew this, with worm for snake and gall for wine. They recoiled to such pleasure as yet remained possible to them—feeble infidelities, and luxurious sciences, and so went their way.

§ 4. At least, of the men with whom we are concerned—the artists—this was almost the universal fate. They gave themselves to the following of pleasure only; and, as a religious school, after a few pale rays of fading sanctity from Guido, and brown gleams of gipsy Madonnahood from Murillo, came utterly to an end.

Three men only stood firm, facing the new Dionysiac revel, to see what would come of it.

Two in the north, Holbein and Dürer; and, later, one in the south, Salvator.

But the ground on which they stood differed strangely; Dürer and Holbein, amidst the formal delights, the tender religions, and practical science, of domestic life and honest commerce. Salvator, amidst the pride of lascivious wealth, and the outlawed distress of impious poverty.

§ 5. It would be impossible to imagine any two phases of scenery or society more contrary in character, more opposite in teaching, than those surrounding Nuremberg and Naples, in the sixteenth and seventeenth centuries. What they were then, both districts still to all general intents remain. The cities have in each case lost their splendour and power, but not their character. The surrounding scenery remains wholly unchanged. It is still in our power, from the actual aspect of the places, to conceive their effect on the youth of the two painters.

§ 6. Nuremberg is gathered at the base of a sandstone

rock, rising in the midst of a dry but fertile plain. The rock forms a prolonged and curved ridge, of which the concave side, at the highest point, is precipitous; the other slopes gradually to the plain. Fortified with wall and tower along its whole crest, and crowned with a stately castle, it defends the city—not with its precipitous side—but with its slope. The precipice is turned to the town. It wears no aspect of hostility towards the surrounding fields; the roads lead down into them by gentle descents from the gates. To the south and east the walls are on the level of the plain; within them, the city itself stands on two swells of hill, divided by a winding river. Its architecture has, however, been much overrated.¹ The effect of the streets, so delightful to the eye of the passing traveller, depends chiefly on one appendage of the roof, namely, its warehouse windows. Every house, almost without exception, has at least one boldly opening dormer window, the roof of which sustains a pulley for raising goods; and the under part of this strong overhanging roof is always carved with a rich pattern, not of refined design, but effective.* Among these comparatively modern structures are mingled, however, not unfrequently, others, turreted at the angles, which are true Gothic of the fifteenth, some of the fourteenth, century; and the principal churches remain nearly as in Dürer's time. Their Gothic is none of it good, nor even rich (though the façades have their ornament so distributed as to give them a sufficiently elaborate effect at a distance); their size is diminutive; their interiors mean, rude, and ill-proportioned, wholly dependent for their interest on ingenious stone-cutting in corners, and finely-twisted

* To obtain room for the goods, the roofs slope steeply, and their other dormer windows are richly carved—but all are of wood; and, for the most part, I think, some hundred years later than Dürer's time. A large number of the oriel and bow windows on the façades are wooden also, and of recent date.

¹ [For other references to the architecture of Nuremberg, see *Stones of Venice*, vol. iii. (Vol. XI. p. 2); *Notes on Prout and Hunt*, Vol. XIV. p. 433; and *Val d'Arno*, § 36.]

ironwork; of these the mason's exercises are in the worst possible taste, possessing not even the merit of delicate execution; but the designs in metal are usually meritorious, and Fischer's shrine of St. Sebald¹ is good, and may rank with Italian work.*

§ 7. Though, however, not comparable for an instant to any great Italian or French city, Nuremberg possesses one character peculiar to itself, that of a self-restrained, contented, quaint domesticity. It would have been vain to expect any first-rate painting, sculpture, or poetry, from the well-regulated community of merchants of small ware. But it is evident they were affectionate and trustworthy—that they had playful fancy and honourable pride. There is no exalted grandeur in their city, not any deep beauty; but an imaginative homeliness, mingled with some elements of melancholy and power, and a few even of grace.

This homeliness, among many other causes, arises out of one in chief. The richness of the houses depends, as I just said, on the dormer windows; but their deeper character on the pitch and space of roofs. I had to notice long ago how much our English cottage depended for expression on its

* His piece in the cathedral of Magdeburg is strangely inferior, wanting both the grace of composition and bold handling of the St. Sebald's. The bronze fountains at Nuremberg (three, of fame, in as many squares) are highly wrought, and have considerable merit; the ordinary ironwork of the houses, with less pretension, is, perhaps, more truly artistic. In Plate 52 (p. 40), the right-hand figure is a characteristic example of the bell-handle at the door of a private house, composed of a wreath of flowers and leafage twisted in a spiral round an upright rod, the spiral terminating below in a delicate tendril; the whole of wrought-iron. It is longer than represented, some of the leaf links of the chain being omitted in the dotted spaces, as well as the handle, which though often itself of leafage, is always convenient for the hand.

¹ [In bronze: in the choir of St. Sebald's Church; the masterpiece of Peter Vischer (1455-1529), who worked at it for twelve years (1508-1519), assisted by his five sons. His piece in the Cathedral of Magdeburg—the Monument of Archbishop Ernest, in the Lady Chapel—is an earlier work (completed in 1495). Among the famous bronze fountains of Nuremberg are (1) the *Tugendbrunnen*, in the square of St. Lorenz (by Wurzelbauer, 1589); (2) the "*Gänsemännchen*," in the Goose Market (by Pancraz Labenwolf, 1557); and (3) the fountain, by the same artist (1556), in the courtyard of the Rathhaus.]

76. The Moat of Nuremberg

steep roofs.¹ The German house does so in far greater degree. Plate 76 is engraved* from a slight pen-and-ink sketch of mine on the ramparts of Nuremberg, showing a piece of its moat and wall, and a little corner of the city beneath the castle; of which the tower on the extreme right rises just in front of Dürer's house. The character of this scene approaches more nearly that which Dürer would see in his daily walks, than most of the modernized inner streets. In Dürer's own engraving, "The Cannon," the distance (of which the most important passage is facsimiled in my *Elements of Drawing*, § 98²) is an actual portrait of part of the landscape seen from those castle ramparts, looking towards Franconian Switzerland.

§ 8. If the reader will be at the pains to turn to it, he will see at a glance the elements of the Nuremberg country, as they still exist. Wooden cottages, thickly grouped, enormously high in the roofs; the sharp church spire, small and slightly grotesque, surmounting them; beyond, a richly cultivated, healthy plain, bounded by woody hills. By a strange coincidence the very plant which constitutes the staple produce of those fields, is in almost ludicrous harmony with the grotesqueness and neatness of the architecture around; and one may almost fancy that the builders of the little knotted spires and turrets of the town, and workers of its dark iron flowers, are in spiritual presence, watching and guiding the produce of the field,—when one finds the footpaths bordered, everywhere, by the bossy spires and lustrous jetty flowers of the black hollyhock.

§ 9. Lastly, when Dürer penetrated among those hills of Franconia he would find himself in a pastoral country, much resembling the Gruyère districts of Switzerland, but less thickly inhabited, and giving in its steep, though not

* By Mr. Le Keux, very admirably.

¹ [The reference seems to be to *Stones of Venice*, vol. i. ch. xiii. (Vol. IX. p. 187), where, however, the point is made not specially of English cottages, but of "the steep roof throughout the North."]

² [See Fig. 13 in Vol. XV. p. 86.]

lofty, rocks,—its scattered pines,—and its fortresses and chapels, the motives of all the wilder landscape introduced by the painter in such pieces as his *St. Jerome*, or *St. Hubert*.¹ His continual and forced introduction of sea in almost every scene, much as it seems to me to be regretted, is possibly owing to his happy recollections of the sea-city where he received the rarest of all rewards granted to a good workman; and, for once in his life, was understood.²

§ 10. Among this pastoral simplicity and formal sweetness of domestic peace, Dürer had to work out his question concerning the grave. It haunted him long; he learnt to engrave death's-heads well before he had done with it; looked deeper than any other man into those strange rings, their jewels lost; and gave answer at last conclusively in his great *Knight and Death*—of which more presently. But while the Nuremberg landscape is still fresh in our minds, we had better turn south quickly, and compare the elements of education which formed, and of creation which companioned, *Salvator*.³

§ 11. Born with a wild and coarse nature (how coarse I will show you soon), but nevertheless an honest one, he set himself in youth hotly to the war, and cast himself carelessly on the current, of life. No rectitude of ledger-lines stood in his way; no tender precision of household customs; no calm successions of rural labour. But past his half-starved lips rolled profusion of pitiless wealth; before him glared and swept the troops of shameless pleasure. Above him muttered *Vesuvius*; beneath his feet shook the *Solfatara*.

In heart disdainful, in temper adventurous; conscious of power, impatient of labour, and yet more of the pride

¹ [For another reference to Dürer's "*St. Jerome*" and "*St. Hubert*," see *Eagle's Nest*, Preface; and for the latter see also above, Part vi. ch. x. § 19 (p. 126); *Stones of Venice*, vol. iii. (Vol. XI. p. 58); and *Lectures on Art*, § 47.]

² [For an extract from Dürer's diary describing the appreciation of him shown by Giovanni Bellini, see *Stones of Venice*, vol. i., Appendix 11 (Vol. IX. p. 436).]

³ [For particulars of the painter's career, see *The Life and Times of Salvator Rosa*, by Lady Morgan (new edition, 1855).]

of the patrons of his youth, he fled to the Calabrian hills, seeking, not knowledge, but freedom. If he was to be surrounded by cruelty and deceit, let them at least be those of brave men or savage beasts, not of the timorous and the contemptible. Better the wrath of the robber, than enmity of the priest; and the cunning of the wolf than of the hypocrite.

§ 12. We are accustomed to hear the south of Italy spoken of as a beautiful country. Its mountain forms are graceful above others, its sea bays exquisite in outline and hue; but it is only beautiful in superficial aspect. In closer detail it is wild and melancholy.¹ Its forests are sombre-leaved, labyrinth-stemmed; the carubbe, the olive, laurel, and ilex, are alike in that strange feverish twisting of their branches, as if in spasms of half human pain:—Avernus forests; one fears to break their boughs, lest they should cry to us from the rents; the rocks they shade are of ashes, or thrice-molten lava; iron sponge whose every pore has been filled with fire. Silent villages, earthquake shaken, without commerce, without industry, without knowledge, without hope, gleam in white ruin from hillside to hillside; far-winding wrecks of immemorial walls surround the dust of cities long forsaken: the mountain streams moan through the cold arches of their foundations, green with weed, and rage over the heaps of their fallen towers. Far above, in thunder-blue serration, stand the eternal edges of the angry Apennine, dark with rolling impendence of volcanic cloud.

§ 13. Yet even among such scenes as these, Salvator might have been calmed and exalted, had he been, indeed, capable of exaltation. But he was not of high temper enough to perceive beauty. He had not the sacred sense—the sense of colour;² all the loveliest hues of the Calabrian air were invisible to him; the sorrowful desolation of the

¹ [For Ruskin's first impressions of Southern Italy in this sense, see *Præterita*, ii. ch. iii. §§ 49–51.]

² [For another reference to Salvator in this sense, see *Stones of Venice*, vol. ii. (Vol. X. pp. 173–174).]

Calabrian villages unfelt. He saw only what was gross and terrible,—the jagged peak, the splintered tree, the flowerless bank of grass, and wandering weed, prickly and pale. His temper confirmed itself in evil, and became more and more fierce and morose; though not, I believe, cruel, ungenerous, or lascivious. I should not suspect Salvator of wantonly inflicting pain. His constantly painting it does not prove he delighted in it; he felt the horror of it, and in that horror, fascination. Also, he desired fame, and saw that here was an untried field rich enough in morbid excitement to catch the humour of his indolent patrons. But the gloom gained upon him, and grasped him. He could jest, indeed, as men jest in prison-yards (he became afterwards a renowned mime in Florence); his satires are full of good mocking, but his own doom to sadness is never repealed.

§ 14. Of all men whose work I have ever studied, he gives me most distinctly the idea of a lost spirit. Michelet¹ calls him, “Ce damné Salvator,” perhaps in a sense merely harsh and violent; the epithet to me seems true in a more literal, more merciful sense,—“That condemned Salvator.” I see in him, notwithstanding all his baseness, the last traces of spiritual life in the art of Europe. He was the last man to whom the thought of a spiritual existence presented itself as a conceivable reality. All succeeding men, however powerful—Rembrandt, Rubens, Vandyck, Reynolds—would have mocked at the idea of a spirit. They were men of the world; they are never in earnest, and they are never appalled. But Salvator was capable of pensiveness, of faith, and of fear. The misery of the earth is a marvel to him; he cannot leave off gazing at it. The religion of the earth is a horror to him. He gnashes his teeth at it, rages at it, mocks and gibes at it. He would have acknowledged religion, had he seen any that was true. Anything rather than that baseness which he

¹ [*Du Prêtre, de la Femme, de la Famille*. Paris: 1845, p. 47. The passage is again referred to in *Modern Painters*, vol. ii. (Vol. IV. p. 201 n.).]

did see. "If there is no other religion than this of pope and cardinals, let us to the robber's ambush and the dragon's den." He was capable of fear also. The gray spectre, horse-headed, striding across the sky—in the Pitti Palace—its bat wings spread, green bars of the twilight seen between its bones; it was no play to him—the painting of it.¹ Helpless Salvator! A little early sympathy, a word of true guidance, perhaps, had saved him. What says he of himself? "Despiser of wealth and of death."² Two grand scorns; but, oh, condemned Salvator! the question is not for man what he can scorn, but what he can love.³

§ 15. I do not care to trace the various hold which Hades takes on this fallen soul. It is no part of my work here to analyze his art, nor even that of Dürer; all that we need to note is the opposite answer they gave to the question about death.

To Salvator it came in narrow terms. Desolation, without hope, throughout the fields of nature he had to explore; hypocrisy and sensuality, triumphant and shameless, in the

¹ [The picture is the "Temptation of St. Anthony." Ruskin, in his Florentine diary (1845), thus describes it:—

"A fine thought in its way, showing more mind than any other Salvator in the Pitti. The colossal skeleton figure is very ghastly, the black clouds and green lighted sky equally so; and though we might complain of the beggar man put for St. Anthony, yet he is useful because he throws the spectre more into the shade by the full light upon him. It is remarkable how much the horror and power of the whole depend on the green lights of the gaps in the sky, how much they would diminish were the background altogether gloom."

For other references to the picture, see *Modern Painters*, vol. ii. (Vol. IV. pp. 86 n., 319 n.).]

² [The reference is to Salvator's etching known as the "Genius of Salvator Rosa." The scene represents a wooded spot, with a fragment of architectural ruin, shaded by cypress trees, before which stands the figure of a Roman philosopher, holding a balance in his hand. Near him stands a satyr, holding a roll of paper which he points to the balance. At the feet of both reclines a man who carelessly rejects the treasures which Wealth pours from her cornucopia; a dead dove lies on his bosom, and his eyes are turned to Liberty, who presents her cap. Painting appears in the background, leaning on an entablature; and underneath Salvator has engraved the following distich:—

"Ingenuus, liber, Pictor, succensor et æquus,
Spretor opum, et mortis, hic meus est genius."]

³ [Compare Ruskin's use of Wordsworth's line, "We live by admiration, hope, and love" (Vol. V. p. 28, and a note in the author's index to *Fors Clavigera*); see also *Eagle's Nest*, § 169.]

cities from which he derived his support. His life, so far as any nobility remained in it, could only pass in horror, disdain, or despair. It is difficult to say which of the three prevails most in his common work; but his answer to the great question was of despair only. He represents "Umana Fragilita"¹ by the type of a skeleton with plummy wings, leaning over a woman and child; the earth covered with ruin round them—a thistle, casting its seed, the only fruit of it. "Thorns, also, and thistles shall it bring forth to thee."² The same tone of thought marks all Salvator's more earnest work.

§ 16. On the contrary, in the sight of Dürer, things were for the most part as they ought to be. Men did their work in his city and in the fields round it. The clergy were sincere. Great social questions unagitated; great social evils either non-existent, or seemingly a part of the nature of things, and inevitable. His answer was that of patient hope; and twofold, consisting of one design in praise of Fortitude, and another in praise of Labour. The Fortitude, commonly known as the "Knight and Death,"³ represents a knight riding through a dark valley overhung by leafless trees, and with a great castle on a hill beyond. Beside him, but a little in advance, rides Death on a pale horse. Death is gray-haired and crowned;—serpents wreathed about his crown; (the sting of Death involved in the kingly power). He holds up the hour-glass, and looks earnestly into the knight's face. Behind him follows Sin; but Sin powerless; he has been conquered and passed by, but follows yet, watching if any way of assault remains. On his forehead

¹ [This was a famous picture which, with a companion piece, "Fortuna," painted in Rome, caused Salvator to be threatened by the Inquisition; for a fuller description of it, see Lady Morgan's book, p. 167.]

² [Genesis iii. 18.]

³ [Ruskin placed a copy of this engraving in his Drawing School at Oxford; see his Catalogue of the "Standard Series" (No. 9), where he interprets the allegory somewhat differently—not as "the victory of human patience over death and sin," but as Nemesis, "the patience and victory being meant to be Death's and the Fiend's, not the rider's"; see note on that passage. For other references to the sentiment of the Plate, see Vol. XI. p. 172, *Time and Tide*, § 51 (where the interpretation given here is accepted); and to its technique, Vol. V. p. 137.]

are two horns—I think of sea-shell—to indicate his insatiableness and instability. He has also the twisted horns of the ram, for stubbornness, the ears of an ass, the snout of a swine, the hoofs of a goat. Torn wings hang useless from his shoulders, and he carries a spear with two hooks, for catching as well as wounding. The knight does not heed him, nor even Death, though he is conscious of the presence of the last.

He rides quietly, his bridle firm in his hand, and his lips set close in a slight sorrowful smile, for he hears what Death is saying; and hears it as the word of a messenger who brings pleasant tidings, thinking to bring evil ones. A little branch of delicate heath is twisted round his helmet. His horse trots proudly and straight; its head high, and with a cluster of oak on the brow where on the fiend's brow is the sea-shell horn. But the horse of Death stoops its head; and its rein catches the little bell which hangs from the knight's horse-bridle, making it toll as a passing-bell.*

* This was first pointed out to me by a friend—Mr. Robin Allen.¹ It is a beautiful thought: yet, possibly, an after-thought. I have some suspicion that there is an alteration in the plate at that place, and that the rope to which the bell hangs was originally the line of the chest of the

¹ [Mr. Robin Allen was Secretary to the Trinity House. He had approached Ruskin for help in the study of art. From some letters (communicated to the editors by his daughter, Miss Allen, of Girton College, Cambridge) it appears that Ruskin lent him various Plates by Turner and Dürer to copy. In sending the "Knight and Death" Ruskin wrote (January 12, 1855):—

"You will in it see the finest possible work of the human hand and thought, as far as they can be put or expressed in black lines. It is impossible to copy these Albert engravings except with the steel point on copper, but with a fine steel pen you can try one or two little bits—just to make you feel them more—the hair on the forehead of Death's horse, for instance, or the chin of the Dog, or the branches of the trees.

"When you have done so, gather a twig from any bush, and stick it before you against a sheet of white paper, and draw it from nature in Albert Dürer's manner, with a steel pen as well as you can—not too much, a mere twig to begin with. Always as smooth paper as you can get, thick white post very good; and ink not fresh, but that has been about the house some time and is black and thickish. Outline the twig carefully in pencil first, shutting one eye and not moving the other, or you will get puzzled. Let the twig be small, so that you can draw it real size—with all its knots and oddnesses."]

§ 17. Dürer's second answer is the plate of "Melencholia," which is the history of the sorrowful toil of the earth, as the "Knight and Death" is of its sorrowful patience under temptation.

Salvator's answer, remember, is in both respects that of despair. Death, as he reads, lord of temptation, is victor over the spirit of man; and lord of ruin, is victor over the work of man. Dürer declares the sad but unsullied conquest over Death the tempter; and the sad but enduring conquest over Death the destroyer.

§ 18. Though the general intent of the Melencholia is clear, and to be felt at a glance, I am in some doubt respecting its special symbolism.¹ I do not know how far Dürer intended to show that labour, in many of its most

nearer horse, as the grass blades about the lifted hind leg conceal the lines which could not, in Dürer's way of work, be effaced, indicating its first intended position. What a proof of his general decision of handling is involved in this "repentir!"

¹ [In the first draft the doubt about the interpretation is thus further explained:—"I am still in some doubt respecting the symbolism of the Melencholia, Dürer's second answer. I do not know whether the word on the scroll indeed refers to the principal figure, and Dürer therefore meant to express the sadness (wild and dark or melancholic sadness) of the Northern mind, leading it to cruel but noble toil; or whether he intended the figure for the spirit of Toil itself; and the Melencholia (written on the wings) refers to the departing fiend and setting of the comet as the rainbow appears. I believe the first is the true meaning, but in either case the general purpose of the design is the history of human labour."

This Plate, again, was placed by Ruskin in his "Standard Series" (No. 4): see his Catalogue, where he refers to the present chapter, and explains the Melencholia as "the best type of the spirit of labour in which the greater number of strong men at the present day have to work;" though at the same time warning his pupils "against overrating the depth of the feeling in which the grave or terrible designs of the masters of the sixteenth century were executed." For other references to the sentiment of the Plate, see Vol. V. p. 134; to its technique, Vol. VI. p. 64 n. The "Knight and Death" was executed in 1513; the "Melencholia" in 1514, and in the same year appeared the "St. Jerome in his Study" (see above, p. 306). Dürer dwells so much in his writings upon the dominating influence of the Four Temperaments in life, that many commentators suppose the three Plates to have been part of a series intended to represent the Sanguine ("Knight and Death"), Melancholic, Phlegmatic ("St. Jerome"), and Choleric Temperaments. The magic square, bell, and hour-glass in the background of the Melencholia are interpreted as referring to the death of the artist's mother (May 17, 1514): see Anton Springer's *Albert Dürer*, ch. x. (Berlin, 1892); Lionel Cust's *Albert Dürer's Engravings* ("Portfolio Monograph," 1894), pp. 63-64; and Sir Martin Conway's *Literary Remains of Albrecht Dürer* (Cambridge, 1889), p. 153.]

earnest forms, is closely connected with the morbid sadness or "dark anger," of the northern nations. Truly some of the best work ever done for man, has been in that dark anger;* but I have not yet been able to determine for myself how far this is necessary, or how far great work may also be done with cheerfulness. If I knew what the truth was, I should be able to interpret Dürer better; meantime the design seems to me his answer to the complaint, "Yet is his strength labour and sorrow."¹

"Yes," he replies, "but labour and sorrow are his strength."

§ 19. The labour indicated is in the daily work of men. Not the inspired or gifted labour of the few (it is labour connected with the sciences, not with the arts), shown in its four chief functions: thoughtful, faithful, calculating, and executing.

Thoughtful, first; all true power coming of that resolved, resistless calm of melancholy thought. This is the first and last message of the whole design. Faithful, the right arm of the spirit resting on the book. Calculating (chiefly in the sense of self-command), the compasses in her right hand. Executive—roughest instruments of labour at her feet: a crucible, and geometrical solids, indicating her work in the sciences. Over her head the hour-glass and the bell, for their continual words, "Whatsoever thy hand findeth to do."² Beside her, childish labour (lesson-learning?) sitting on an old millstone, with a tablet on its

* "Yet withal, you see that the Monarch is a great, valiant, cautious, melancholy, commanding man."—*Friends in Council*, last volume,³ p. 269; Milverton giving an account of Titian's picture of Charles the Fifth. (Compare Ellesmere's description of Milverton himself, p. 140.) Read carefully also what is said at p. 269 respecting Titian's freedom, and fearless withholding of flattery; comparing it with the note on Giorgione and Titian, here, pp. 439-440.

knees. I do not know what instrument it has in its hand. At her knees a wolf-hound asleep. In the distance a comet (the disorder and threatening of the universe) setting, the rainbow dominant over it. Her strong body is close girded for work; at her waist hang the keys of wealth; but the coin is cast aside contemptuously under her feet. She has eagle's wings, and is crowned with fair leafage of spring.

Yes, Albert of Nuremberg, it was a noble answer, yet an imperfect one. This is indeed the labour which is crowned with laurel and has the wings of the eagle. It was reserved for another country to prove, for another hand to pourtray, the labour which is crowned with fire, and has the wings of the bat.¹

¹ [See above, § 14, p. 308; and below, ch. x, § 25, p. 408.]

CHAPTER V

CLAUDE AND POUSSIN

§ 1. It was stated in the last chapter that Salvator was the last painter of Italy on whom any fading trace of the old faithful spirit rested. Carrying some of its passion far into the seventeenth century, he deserved to be remembered together with the painters whom the questioning of the Reformation had exercised eighty years before. Not so his contemporaries. The whole body of painters around him, but chiefly those of landscape, had cast aside all regard for the faith of their fathers, or for any other; and founded a school of art properly called "classical,"* of which the following are the chief characteristics.

§ 2. The belief in a supreme benevolent Being having ceased, and the sense of spiritual destitution fastening on the mind, together with the hopeless perception of ruin and decay in the existing world, the imagination sought to quit itself from the oppression of these ideas by realizing a perfect worldly felicity, in which the inevitable ruin should at least be lovely, and the necessarily short life entirely happy and refined. Labour must be banished, since it was to be unrewarded. Humiliation and degradation of body must be prevented, since there could be no compensation for them by preparation of the soul for another world. Let us eat and drink (refinedly), for to-morrow we die,¹ and attain the highest possible dignity as men in this world, since we shall have none as spirits in the next.

* The word "classical" is carelessly used in the preceding volumes, to signify the characters of the Greek or Roman nations. Henceforward, it is used in a limited and accurate sense, as defined in the text.

¹ [Quoted also in Vol. XIV. p. 341.]

§ 3. Observe, this is neither the Greek nor the Roman spirit. Neither Claude nor Poussin, nor any other painter or writer, properly termed "classical," ever could enter into the Greek or Roman heart, which was as full, in many cases fuller, of the hope of immortality than our own.

On the absence of belief in a good supreme Being, follows, necessarily, the habit of looking to ourselves for supreme judgment in all matters, and for supreme government. Hence, first, the irreverent habit of judgment instead of admiration. It is generally expressed under the justly degrading term "good taste."

§ 4. Hence, in the second place, the habit of restraint or self-government (instead of impulsive and limitless obedience), based upon pride, and involving, for the most part, scorn of the helpless and weak, and respect only for the orders of men who have been trained to this habit of self-government. Whence the title classical, from the Latin *classicus*.

§ 5. The school is, therefore, generally to be characterized as that of taste and restraint. As the school of taste, everything is, in its estimation, beneath it, so as to be tasted or tested; not above it, to be thankfully received. Nothing was to be fed upon as bread; but only palated as a dainty. This spirit has destroyed art since the close of the sixteenth century, and nearly destroyed French literature, our English literature being at the same time severely depressed, and our education (except in bodily strength) rendered nearly nugatory by it, so far as it affects commonplace minds. It is not possible that the classical spirit should ever take possession of a mind of the highest order. Pope is, as far as I know, the greatest man who ever fell strongly under its influence; and though it spoiled half his work, he broke through it continually into true enthusiasm and tender thought.* Again, as the school of reserve,

* Cold-hearted, I have called him.¹ He was so in writing the Pastorals,

¹ [See *Modern Painters*, vol. iii. (Vol. V. p. 216); for a note on Ruskin's estimate of Pope generally, see Vol. XVI. p. 446.]

it refuses to allow itself in any violent or "spasmodic" passion; the schools of literature which have been in modern times called "spasmodic" being reactionary against it. The word, though an ugly one, is quite accurate, the most spasmodic books in the world being Solomon's Song, Job, and Isaiah.

§ 6. The classical landscape, properly so called, is therefore the representative of perfectly trained and civilized human life, associated with perfect natural scenery and with decorative spiritual powers.

I will expand this definition a little.

(1.) Perfectly civilized human life; that is, life freed from the necessity of humiliating labour, from passions inducing bodily disease, and from abasing misfortune. The personages of the classical landscape, therefore, must be virtuous and amiable; if employed in labour, endowed with strength, such as may make it not oppressive. (Considered as a practical ideal, the classical life necessarily implies slavery, and the command, therefore, of a higher order of men over a lower, occupied in servile work.) Pastoral occupation is allowable as a contrast with city life. War, if undertaken by classical persons, must be a contest for honour, more than for life, not at all for wealth,* and free from all fearful or debasing passion. Classical persons must be trained in all the polite arts, and, because their health is to be perfect, chiefly in the open air. Hence, the architecture around them must be of the most finished kind, the rough country and ground being subdued by frequent and happy humanity.

§ 7. (2.) Such personages and buildings must be associated with natural scenery, uninjured by storms or inclemency of climate (such injury implying interruption of the open-air life); and it must be scenery conducing to pleasure,

of which I then spoke; but in after life his errors were those of his time, his wisdom was his own; it would be well if we also made it ours.

* Because the pursuit of wealth is inconsistent at once with the peace and dignity of perfect life.

not to material service; all cornfields, orchards, olive-yards, and such like, being under the management of slaves,* and the superior beings having nothing to do with them; but passing their lives under avenues of scented and otherwise delightful trees,—under picturesque rocks, and by clear fountains.

§ 8. (3.) The spiritual powers in classical scenery must be decorative; ornamental gods, not governing gods; otherwise they could not be subjected to the principles of taste, but would demand reverence. In order, therefore, as far as possible, without taking away their supernatural power, to destroy their dignity, they are made more criminal and capricious than men, and, for the most part, those only are introduced who are the lords of lascivious pleasures. For the appearance of any great god would at once destroy the whole theory of the classical life; therefore, Pan, Bacchus, and the Satyrs, with Venus and the Nymphs, are the principal spiritual powers of the classical landscape. Apollo with the Muses appear as the patrons of the liberal arts. Minerva rarely presents herself (except to be insulted by judgment of Paris); Juno seldom, except for some purpose of tyranny; Jupiter seldom, but for purpose of amour.

§ 9. Such being the general ideal of the classical landscape, it can hardly be necessary to show the reader how such charm as it possesses must in general be strong only over weak or second-rate orders of mind. It has, however, been often experimentally or playfully aimed at by great men; but I shall only take note of its two leading masters.

§ 10. Claude. (I.) As I shall have no farther occasion to refer to this painter, I will resume, shortly, what has been said of him throughout the work. He had a fine feeling for beauty of form, and considerable tenderness of perception.

* It is curious, as marking the peculiarity of the classical spirit in its resolute degradation of the lower orders, that a sailing vessel is hardly admissible in a classical landscape, because its management implies too much elevation of the inferior life. But a galley, with oars, is admissible, because the rowers may be conceived as absolute slaves.

(Vol. I., p. 75; Vol. III., p. 325.¹) His aerial effects are unequalled. (Vol. III., p. 326.) Their character appears to me to arise rather from a delicacy of bodily constitution in Claude, than from any mental sensibility: such as they are, they give a kind of feminine charm to his work, which partly accounts for its wide influence. To whatever the character may be traced, it renders him incapable of enjoying or painting anything energetic or terrible. Hence the weakness of his conceptions of rough sea. (Vol. I., p. 76.)

(II.) He had sincerity of purpose. (Vol. III., p. 325.) But in common with other landscape painters of his day, neither earnestness, humility, nor love, such as would ever cause him to forget himself. (Vol. I., p. 76.)

That is to say, so far as he felt the truth, he tried to be true; but he never felt it enough to sacrifice supposed propriety or habitual method to it. Very few of his sketches, and none of his pictures, show evidence of interest in other natural phenomena than the quiet afternoon sunshine which would fall methodically into a composition. One would suppose he had never seen scarlet in a morning cloud, nor a storm burst on the Apennines. But he enjoys a quiet misty afternoon in a ruminant sort of way (Vol. III., p. 329), yet truly; and strives for the likeness of it, therein differing from Salvator, who never attempts to be truthful, but only to be impressive.

§ 11. (III.) His seas are the most beautiful in old art. (Vol. I., p. 340.) For he studied tame waves, as he did tame skies, with great sincerity, and some affection; and modelled them with more care not only than any other landscape painter of his day, but even than any of the great men; for they, seeing the perfect painting of sea to

¹ [These and the following references in the text are to the original editions of *Modern Painters*. They may be thus summarised with reference to this edition: Vol. III. (*Modern Painters*, vol. i.), pp. 41-42, 167, 168, 517; Vol. IV. p. 231; Vol. V. pp. 400, 401-405. For other earlier references to Claude in *Modern Painters* and elsewhere, see the General Index. Ruskin returned to him for a moment in the lectures in *The Art of England* (1884), § 9, when he spoke of his sunshine as "colourless,—only the golden haze of a quiet afternoon."]

be impossible, gave up the attempt, and treated it conventionally. But Claude took so much pains about this, feeling it was one of his *fortes*, that I suppose no one can model a small wave better than he.

IV. He first set the pictorial sun in the pictorial heaven. (Vol. III., p. 325.) We will give him the credit of this, with no drawbacks.

V. He had hardly any knowledge of physical science (Vol. I., p. 75), and shows a peculiar incapacity of understanding the main point of a matter. (Vol. III., p. 329.) Connected with which incapacity is his want of harmony in expression. (Vol. II., p. 144.) (Compare, for illustration of this, the account of the picture of the Mill in the preface to Vol. I.)

§ 12. Such were the principal qualities of the leading painter of classical landscape, his effeminate softness causing him to dislike all evidences of toil, or distress, or terror, and to delight in the calm formalities which mark the school.

Although he often introduces romantic incidents and mediæval as well as Greek or Roman personages, his landscape is always in the true sense classic—everything being “elegantly” (selectingly or tastefully), not passionately, treated. The absence of indications of rural labour, of hedges, ditches, haystacks, ploughed fields, and the like; the frequent occurrence of ruins of temples, or masses of unruined palaces; and the graceful wildness of growth in his trees, are the principal sources of the “elevated” character which so many persons feel in his scenery.

There is no other sentiment traceable in his work than this weak dislike to entertain the conception of toil or suffering. Ideas of relation, in the true sense, he has none; nor ever makes an effort to conceive an event in its probable circumstances, but fills his foregrounds with decorative figures, using commonest conventionalism to indicate the subject he intends. We may take two examples, merely to show the general character of such designs of his.

§ 13. (1.) St. George and the Dragon.¹

The scene is a beautiful opening in woods by a river side, a pleasant fountain springs on the right, and the usual rich vegetation covers the foreground. The dragon is about the size of ten bramble leaves, and is being killed by the remains of a lance, barely the thickness of a walking-stick,² in his throat, curling his tail in a highly offensive and threatening manner. St. George, notwithstanding, on a prancing horse, brandishes his sword, at about thirty yards' distance from the offensive animal.

A semicircular shelf of rocks encircles the foreground, by which the theatre of action is divided into pit and boxes. Some women and children having descended unadvisedly into the pit, are helping each other out of it again, with marked precipitation. A prudent person of rank has taken a front seat in the boxes,—crosses his legs, leans his head on his hand, and contemplates the proceedings with the air of a connoisseur. Two attendants stand in graceful attitudes behind him, and two more walk away under the trees, conversing on general subjects.

§ 14. (2.) Worship of the Golden Calf.³

The scene is nearly the same as that of the St. George; but in order better to express the desert of Sinai, the river is much larger, and the trees and vegetation softer. Two people, uninterested in the idolatrous ceremonies, are rowing in a pleasure boat on the river. The calf is about sixteen inches long (perhaps, we ought to give Claude credit for remembering that it was made of ear-rings, though he might as well have inquired how large Egyptian ear-rings were). Aaron has put it on a handsome pillar, under which five people are dancing, and twenty-eight, with several children, worshipping. Refreshments for the dancers are provided in four large vases under a tree on the left, presided over by

¹ [No. 73 in *Liber Veritatis*.]

² [For another illustration of the absurdity of Claude's weapons, see Vol. XII. p. 495 (Fig. 29), and Vol. V. p. 404.]

³ [For another reference to this work (No. 129 in *Liber Veritatis*), see Vol. V. p. 157.]

a dignified person holding a dog in a leash. Under the distant group of trees appears Moses, conducted by some younger personage (Nadab or Abihu). This younger personage holds up his hands, and Moses, in the way usually expected of him, breaks the tables of the law, which are as large as an ordinary octavo volume.

§ 15. I need not proceed farther, for any reader of sense or ordinary powers of thought can thus examine the subjects of Claude, one by one, for himself. We may quit him with these few final statements concerning him.

The admiration of his works was legitimate, so far as it regarded their sunlight effects and their graceful details. It was base, in so far as it involved irreverence both for the deeper powers of nature, and carelessness as to conception of subject. Large admiration of Claude is wholly impossible in any period of national vigour in art. He may by such tenderness as he possesses, and by the very fact of his banishing painfulness, exercise considerable influence over certain classes of minds; but this influence is almost exclusively hurtful to them.

§ 16. Nevertheless, on account of such small sterling qualities as they possess, and of their general pleasantness, as well as their importance in the history of art, genuine Claudes must always possess a considerable value, either as drawing-room ornaments or museum relics. They may be ranked with fine pieces of china manufacture, and other agreeable curiosities, of which the price depends on the rarity rather than the merit, yet always on a merit of a certain low kind.

§ 17. The other characteristic master of classical landscape is Nicolo Poussin.

I named Claude first, because the forms of scenery he has represented are richer and more general than Poussin's; but Poussin has a far greater power, and his landscapes, though more limited in material, are incomparably nobler than Claude's. It would take considerable time to enter into accurate analysis of Poussin's strong but degraded

mind; and bring us no reward, because whatever he has done has been done better by Titian. His peculiarities are, without exception, weaknesses, induced in a highly intellectual and inventive mind by being fed on medals, books, and bassi-relievi instead of nature, and by the want of any deep sensibility. His best works are his Bacchanalian revels, always brightly wanton and wild, full of frisk and fire; but they are coarser than Titian's, and infinitely less beautiful. In all minglings of the human and brutal character he leans on the bestial, yet with a sternly Greek severity of treatment. This restraint, peculiarly classical, is much too manifest in him; for, owing to his habit of never letting himself be free, he does nothing as well as it ought to be done, rarely even as well as he can himself do it; and his best beauty is poor, incomplete, and characterless, though refined. The Nymph pressing the honey in the "Nursing of Jupiter," and the Muse leaning against the tree, in the "Inspiration of Poet" (both in the Dulwich Gallery), appear to me examples of about his highest reach in this sphere.¹

§ 18. His want of sensibility permits him to paint frightful subjects, without feeling any true horror: his pictures of the Plague, the Death of Polydectes, etc., are thus ghastly in incident, sometimes disgusting, but never impressive. The prominence of the bleeding head in the Triumph of David marks the same temper. His battle-pieces are cold and feeble; his religious subjects wholly nugatory, they do not excite him enough to develop even his ordinary powers of invention. Neither does he put much power into his landscape when it becomes principal;

¹ [For the "Nursing of Jupiter" (No. 234 in the Dulwich Gallery), see Vol. III. p. 30; and for the "Inspiration of a Poet" (No. 229), *ibid.*, p. 323 n. The "Plague at Ashdod" is the subject of a picture in the National Gallery (No. 165); also of one in the Louvre (No. 710), for which see Vol. XII. p. 454. By the "Death of Polydectes" Ruskin perhaps refers to Poussin's picture of another incident in the legend of Perseus—namely, "Phineus and his followers turned into stone at the sight of the Gorgon's head"; the picture (formerly in the National Gallery, No. 83) is now in the National Gallery of Dublin. The "Triumph of David" is in the Dulwich Gallery (No. 236). For the "Deluge," in the Louvre (No. 739), see Vol. III. p. 518; Vol. IV. p. 200; Vol. VI. p. 297.]

the best pieces of it occur in fragments behind his figures. Beautiful vegetation, more or less ornamental in character, occurs in nearly all his mythological subjects, but his pure landscape is notable only for its dignified reserve; the great squareness and horizontality of its masses, with lowness of tone, giving it a deeply meditative character. His Deluge might be much depreciated, under this head of ideas of relation, but it is so uncharacteristic of him that I pass it by. Whatever power this lowness of tone, light in the distance, etc., give to his landscape, or to Gaspar's (compare Vol. II., Chapter on Infinity, § 12),¹ is in both conventional and artificial.

I have nothing, therefore, to add farther, here, to what was said of him in Vol. I.;² and, as no other older masters

¹ [In this edition, Vol. IV. p. 86.]

² [In this edition, Vol. III. p. 185. In his "Notes on the Gallery of Turin" (see above, p. xxxix. n.) Ruskin wrote this general characterisation of Poussin under the head of his "St. Margaret and the Dragon" in the Turin Gallery:—

"Poussin is really a great man, but wickedly, or rather brutally, minded, and therefore approaches a sacred subject with utter distaste and incapacity for it. I call him brutally rather than wickedly minded, because he has none of the love of crime and pain for their own sake which Salvator and Caravaggio have.

"Poussin is a sort of amiable beast, liking to see other beasts happy, and having, in his own way, a perception of beauty, and delight in it, such as a horse or fawn might have.

"Nobody ever drew Centaurs like Poussin—he seems a perfect Centaur himself. His female Centaurs especially seem quite the types of his own mind: high-bred creatures they are, exquisitely limbed, fine and fierce in all their senses; gay and bright, full of splendid animal spirit, graceful in neck, quick in eye, lustful, capricious, proud, petulant, all in the extreme. Besides all this, however, as he has a perfect right to his well-known title 'learned' both in the rules of his own art and in classical fable, there results a curious heathen severity mixed with and subduing the sensuality, such as no other painter ever exhibited. Hence he is only seen in perfection in such subjects as the triumph of Flora in the Louvre, or the nursing of Jupiter in the Dulwich Gallery, where his classical taste is shown in the figure of the nymph, and his animal character in the child sucking the goat; or the Bacchanal in the National Gallery, where the satyr is pursuing the female Centaur. In a religious subject like this, which he feels too much the proprieties of art to treat as Guido would have treated it (making St. Margaret merely a pretty lady), and trying, as he thinks he ought to try, to produce something religious and grand and chaste, while his own soul is entirely made up of Bacchanalian passion, it is impossible to fail more utterly: never was such an ugly, dull, hard, ineffective, melancholy, log of a female saint since women *were* saints.

"It is curious also that the classical temper seems as adverse to the true grotesque as it is to the saintly: for the dragon fails us entirely as

of the classical landscape are worth any special note, we will pass on at once to a school of humbler but more vital power.

the saint; and considering how much Poussin knew of animal form, this failure is quite a phenomenon to me. I cannot understand his want of invention in such an easy thing—easy, that is to say, up to a certain point. I must think over this.”

For “learned” Poussin, see Vol. III. p. 18 *n.* ; for “Flora” in the Louvre, see Vol. V. p. 406, and Vol. XII. p. 470 ; the Bacchanal is No. 42 in the National Gallery.]

CHAPTER VI

RUBENS AND CUYP

§ 1. THE examination of the causes which led to the final departure of the religious spirit from the hearts of painters, would involve discussion of the whole scope of the Reformation on the minds of persons unconcerned directly in its progress. This is of course impossible.

One or two broad facts only can be stated, which the reader may verify, if he pleases, by his own labour. I do not give them rashly.

§ 2. The strength of the Reformation lay entirely in its being a movement towards purity of practice.

The Catholic priesthood was hostile to it in proportion to the degree in which they had been false to their own principles of moral action, and had become corrupt or worldly in heart.

The Reformers indeed cast out many absurdities, and demonstrated many fallacies, in the teaching of the Roman Catholic Church. But they themselves introduced errors, which rent the ranks, and finally arrested the march of the Reformation, and which paralyze the Protestant Church to this day. Errors of which the fatality was increased by the controversial bent which lost accuracy of meaning in force of declamation, and turned expressions, which ought to be used only in retired depth of thought, into phrases of custom, or watchwords of attack. Owing to which habits of hot, ingenious, and unguarded controversy, the Reformed Churches themselves soon forgot the meaning of the word which, of all words, was oftenest in their mouths. They forgot that πίστις is a derivative of πείθομαι, not of πιστεύω, and that "fides," closely connected with "fio" on one side,

and with "confido" on the other, is but distantly related to "credo."*

§ 3. By whatever means, however, the reader may himself be disposed to admit, the Reformation *was* arrested; and got itself shut up into chancels of cathedrals in England (even those, generally too large for it), and into conventicles everywhere else. Then rising between the infancy of Reformation, and the palsy of Catholicism;—between a new shell of half-built religion on one side, daubed with untempered mortar, and a falling ruin of out-worn religion on the other, lizard-crannied, and ivy-grown;—rose, on its independent foundation, the faithless and materialized mind of modern Europe—ending in the rationalism of Germany, the polite formalism of England, the careless blasphemy of France, and the helpless sensualities of Italy; in the midst of which, steadily advancing science, and the charities of more and more widely extended peace, are preparing the way for a Christian Church, which shall depend neither on ignorance for its continuance, nor on controversy for its progress, but shall reign at once in light and love.

§ 4. The whole body of painters (such of them as were left,) necessarily fell into the rationalistic chasm. The Evangelicals despised the arts, while the Roman Catholics were effete or insincere, and could not retain influence over men of strong reasoning power.

The painters could only associate frankly with men of

* None of our present forms of opinion are more curious than those which have developed themselves from this verbal carelessness. It never seems to strike any of our religious teachers, that if a child has a father living, it either *knows* it has a father, or does not: it does not "believe" it has a father. We should be surprised to see an intelligent child standing at its garden gate, crying out to the passers-by: "I believe in my father, because he built this house;" as logical people proclaim that they believe in God, because He must have made the world.¹

¹ [In place of this note the MS. reads :—

"It would be hard to say by which of its derivatives that unhappy word 'credo' has done more mischief to mankind,—by its religious one of 'creed,' or its commercial one of 'credit.'"

On these etymologies, see further *Munera Pulveris*, § 81 n., and Appendix v. n.; and in this volume, compare p. 213.]

the world, and themselves became men of the world. Men, I mean, having no belief in spiritual existences, no interests or affections beyond the grave.

§ 5. Not but that they still painted scriptural subjects. Altar-pieces were wanted occasionally, and pious patrons sometimes commissioned a cabinet Madonna. But there is just this difference between the men of this modern period, and the Florentines or Venetians—that whereas the latter never exert themselves fully except on a sacred subject, the Flemish and Dutch masters are always languid unless they are profane. Leonardo is only to be seen in the Cena; Titian only in the Assumption; but Rubens only in the Battle of the Amazons, and Vandyck only at court.¹

§ 6. Altar-pieces, when wanted, of course either of them will supply as readily as anything else. Virgins in blue,* or St. Johns in red,† as many as you please. Martyrdoms also, by all means: Rubens especially delights in these. St. Peter, head downwards,‡ is interesting anatomically; writhings of impenitent thieves, and bishops having their tongues pulled out, display our powers to advantage, also.§ Theological instruction, if required: “Christ armed with thunder, to destroy the world, spares it at the intercession of St. Francis.” || Last Judgments even, quite Michael-Angelesque, rich in twistings of limbs, with spiteful biting, and scratching; and fine aerial effects in smoke of the pit.¶

§ 7. In all this, however, there is not a vestige of religious feeling or reverence. We have even some visible difficulty in meeting our patron’s pious wishes. Daniel in the lion’s den is indeed an available subject, but duller than

* Düsseldorf.
§ Brussels.

† Antwerp.
|| Brussels.

‡ Cologne.
¶ Munich.²

¹ [For Leonardo’s “Cenacolo” at Milan, see Vol. IV. p. 313; Vol. X. p. 306; for Titian’s “Assumption,” above, p. 289; Rubens’s “Battle of the Amazons” is at Munich (though Ruskin’s reference here is perhaps rather of a general character); on Vandyck as a court painter, see *Love’s Meinie*, § 1.]

² [The “Virgin in blue” is the “Assumption” by Rubens in the Academy of Art at Düsseldorf. Ruskin in his diary says of it, “A barbarous Assumption, by Rubens—frightfully vulgar.” The “St. John in red” is in the Museum at Antwerp

a lion hunt; and Mary of Nazareth must be painted if an order come for her; but (says polite Sir Peter), Mary of Medicis, or Catherine, her bodice being fuller, and better embroidered, would, if we might offer a suggestion, probably give greater satisfaction.¹

§ 8. No phenomenon in human mind is more extraordinary than the junction of this cold and worldly temper with great rectitude of principle, and tranquil kindness of heart. Rubens was an honourable and entirely well-intentioned man, earnestly industrious, simple and temperate in habits of life, high-bred, learned and discreet. His affection for his mother was great; his generosity to contemporary artists unfailing. He is a healthy, worthy, kind-hearted, courtly-phrased—Animal—without any clearly perceptible traces of a soul, except when he paints his children. Few descriptions of pictures could be more ludicrous in their pure animalism than those which he gives of his own. "It is a subject," he writes to Sir D. Carleton, "neither sacred nor profane, although taken from Holy Writ, namely, Sarah in the act of scolding Hagar, who, pregnant, is leaving the house in a feminine and graceful manner, assisted by the Patriarch Abram." (What a graceful apology, by

(No. 303). The pictures next mentioned, by Rubens, are described in Ruskin's diary, being Nos. 4, 2, 3 of the following list:—

"1. Christ falling under cross: St. Veronica holding handkerchief.

"2. Martyrdom of St. Lieven (the executioner having torn his tongue out with pincers is giving it to a dog).

"3. Christ armed with thunder to destroy the world.

"4. St. Peter crucified.

"1, 2, 3 at Brussels (Museum) and 4 here [Cologne, Church of St. Peter], the most brutal and beastly pictures I ever saw in my life. Worse even than Salvator, because involving the abuse of a greater power. In 3, Christ stands like a dancing master, only with coarse bandy legs, St. Francis hugs the globe, cowering over it in a panic, and the Virgin points to her fat breast and stretches clumsily across to catch hold of Christ with the other arm. The detestableness of all that is most detestable in Romanist doctrine and its results is concentrated in this picture. All the four are equally bad in colour and touch, virtueless and vile, the distortion of limbs and line all swept about in this kind of way [sketch], and then legs and feet like this [sketch]."

For an earlier reference to the "St. Peter," see Vol. II. p. 352. The "Last Judgment" by Rubens is in the Gallery at Munich.]

¹ [There are "Lion Hunts" by Rubens both at Dresden and at Munich; for his Medici series of pictures, see Vol. V. p. 135 and n.]

the way, instantly follows, for not having finished the picture himself.) "I have engaged, as is my custom, a very skilful man in his pursuit to finish the landscapes, solely to augment the enjoyment of Y. E.!"*

Again, in priced catalogue,—

"50 florins each.—The Twelve Apostles, with a Christ. Done by my scholars, from originals by my own hand, each having to be retouched by my hand throughout.

"600 florins.—A picture of Achilles clothed as a woman; done by the best of my scholars, and the whole retouched by my hand: a most brilliant picture, and full of many beautiful young girls."¹

§ 9. Observe, however, Rubens is always entirely honourable in his statements of what is done by himself and what not. He is religious too, after his manner; hears mass every morning, and perpetually uses the phrase "by the grace of God," or some other such, in writing of any business he takes in hand; but the tone of his religion may be determined by one fact.

We saw how Veronese painted himself, and his family, as worshipping the Madonna.

Rubens has also painted himself and his family in an equally elaborate piece. But they are not *worshipping* the Madonna. They are *performing* the Madonna, and her saintly entourage. His favourite wife "en Madonne"; his youngest boy "as Christ"; his father-in-law (or father, it matters not which) "as Simeon"; another elderly relation, with a beard, "as St. Jerome"; and he himself "as St. George."²

* *Original Papers relating to Rubens*; edited by W. Sainsbury. London, 1859: page 39. Y. E. is the person who commissioned the picture.

¹ [This is from a "List of Pictures which are in my house" enclosed in a letter to Sir Dudley Carleton, April 18, 1618 (*ibid.*, p. 30).]

² [For the picture by Veronese, see above, p. 290. The Rubens is the altar-piece in the private chapel of the Rubens family in the Church of St. Jacques at Antwerp. It is said that his two wives are introduced as Martha and Mary Magdalen, and his father as St. Jerome. For another comparison between the two pictures, see Vol. XVI. p. 470.]

§ 10. Rembrandt has also painted (it is, on the whole, his greatest picture, so far as I have seen) himself and his wife in a state of ideal happiness. He sits at supper with his wife on his knee, flourishing a glass of champagne, with a roast peacock on the table.¹

The Rubens is in the Church of St. James at Antwerp; the Rembrandt at Dresden—marvellous pictures, both. No more precious works by either painter exist. Their hearts, such as they have, are entirely in them; and the two pictures, not inaptly, represent the Faith and Hope of the seventeenth century. We have to stoop somewhat lower, in order to comprehend the pastoral and rustic scenery of Cuyp and Teniers, which must yet be held as forming one group with the historical art of Rubens, being connected with it by Rubens' pastoral landscape. To these, I say, we must stoop lower; for they are destitute, not of spiritual character only, but of spiritual thought.

Rubens often gives instructive and magnificent allegory; Rembrandt, pathetic or powerful fancies, founded on real scripture reading, and on his interest in the picturesque character of the Jew. And Vandyck, a graceful dramatic rendering of received scriptural legends.

But in the pastoral landscape we lose, not only all faith in religion, but all remembrance of it. Absolutely now at last we find ourselves without sight of God in all the world.

§ 11. So far as I can hear or read, this is an entirely new and wonderful state of things achieved by the Hollanders. The human being never got wholly quit of the terror of spiritual being before. Persian, Egyptian, Assyrian, Hindoo, Chinese, all kept some dim, appalling record of what they called "gods." Farthest savages had—and still have—their Great Spirit, or, in extremity, their feather-idols, large-eyed; but here in Holland we have at last got utterly done with it all. Our only idol glitters dimly,

¹ [The portrait is of his first wife, Saskia van Uylenburgh. For other references to it, see *Cestus of Aglaia*, § 54, and *Ariadne Florentina*, § 157.]

in tangible shape of a pint pot, and all the incense offered thereto, comes out of a small censer or bowl at the end of a pipe. "Of deities or virtues, angels, principalities, or powers,¹ in the name of our ditches, no more. Let us have cattle and market vegetables."

This is the first and essential character of the Holland landscape art. Its second is a worthier one; respect for rural life.²

§ 12. I should attach greater importance to this rural feeling, if there were any true humanity in it, or any feeling for beauty. But there is neither. No incidents of this lower life are painted for the sake of the incidents, but only for the effects of light. You will find that the best Dutch painters do not care about the people, but about the lustres on them. Paul Potter, their best herd

¹ [Ephesians iii. 10, quoted in Vol. X. p. 86, and *Munera Pulveris*, § 105.]

² [This chapter was much revised and rewritten. In the first draft the passage on Cuyp was different, and some further illustrations were introduced from the works of Ruysdael:—

"Cuyp's and all other Dutch work is essentially of surface. That looking for the glance of things is almost typical of their temper. It is never the fall of the dress, but its lustre; never the glow of the metal, but its flash; never the colour of the flower, but its smoothness. The Art of vacuity and varnish.

"It has one character of some merit however, a fixed business-like system of light and shade, which gives it an appearance of grandeur. The Dutch painters were well disciplined to their trade, dextrous in common methods of composition. Simple in plan of harmony, certain of touch, successful always up to their intended point. I imagine the Dutchmen to have been well satisfied with all their work, enjoying their tiny dexterities of finishing touch as a heartless speaker enjoys his own accurate pronunciation. Their work once finished, they looked on it complacently, as better than nature. Nature is not shiny, nor dotty, nor properly founded on grey, and has no principal lights. But our picture is Perfection. Nevertheless the appearance of dignity, and the really grammatical truth, attained in these low or sparkling tones by the practised hands of masters who never dared anything that could involve a chance of failure on their own parts, or any surprise or difficulty on that of the spectator, render many of their pictures impressive to persons who bring to them a fresh imagination, and who do not stay long enough to discover their emptiness. Every man of any power of mind is certain to be sometimes strongly impressed by the commonest aspects of nature: a painter who habitually chooses their commonest aspects is sure of catching his sympathies by some of them; and if the spectator has also authority for believing that the picture has merit, he will be more moved by its commonplaceness than he would have been by a work which appealed to new emotions, and demanded an unwonted mental exertion.

"There is a sea-piece of Ruysdael's in the Louvre, creditably painted in a dark grey tone, representing a shallow sea breaking on a reedy shore

and cattle painter, does not care even for sheep, but only for wool; regards not cows, but cowhide.¹ He attains great dexterity in drawing tufts and locks, lingers in the little parallel ravines and furrows of fleece that open across sheep's backs as they turn; is unsurpassed in twisting a horn or pointing a nose; but he cannot paint eyes, nor perceive any condition of an animal's mind, except its desire of grazing. Cuyp can, indeed, paint sunlight, the best that Holland's sun can show;² he is a man of large natural gift, and sees broadly, nay, even seriously; finds out—a wonderful thing for men to find out in those days—that there are reflections in water, and that boats require often to be painted upside down. A brewer by trade, he feels the quiet of a summer afternoon, and his work will make you marvellously drowsy. It is good for nothing else

under a rather uncomfortable north-east wind. It possesses about as much sublimity as Chelsea reach on the Nine Elms side on a March day with a smoky sky over the gasometers at Lambeth. Perhaps any one who had seen an inundation in Holland might be impressed by it, as being the kind of scene and weather likely to end in such extended calamity; but to any one acquainted with deep water and its work, it is not a sea-piece at all, but merely a gloomy study of the edge of a salt marsh. Yet the picture so impressed Michelet as to give rise to this striking passage in his sketch of the life of Swammerdam. . . . There is a little winter subject of Ruysdael at Dresden which I can imagine in like manner becoming very impressive to any person who had seen much suffering from cold; but in every case in which a Dutch picture thus appears sublime, the effect is merely due to the use of a minor key of colour, the absence of beautiful forms, and an accidental association. Had the snow, the sea, or the reeds been better painted, their beauty would have broken the dulness of the work; it is only by decrepitude and deficiency, not by pensiveness, that the Dutch depress us."

The Ruysdael in the Louvre is No. 2558; for other references to it, see Vol. III. p. 516, and Vol. XII. p. 454. The reference to Michelet's "sketch of the life of Swammerdam" is in book ii. ch. i. of his *L'Insecte* (already cited; above, p. 232); the reference to Ruysdael's picture is at p. 137 of the English edition.]

¹ [Compare a somewhat similar criticism on Rosa Bonheur in *Academy Notes*, 1858 (Vol. XIV. p. 174).]

² [For Cuyp's painting of sunlight, see Vol. III. pp. 268, 271, 272, 350; Vol. XIII. p. 545; Vol. XIV. p. 225; for his water and reflections, Vol. III. pp. 520, 525; for his clouds and skies, Vol. III. pp. 356, 368; for his foregrounds, Vol. III. p. 484; for his leaf-drawing, above, pt. vi. ch. v. §§ 3, 7 (pp. 52, 55). In all these passages the general tenour of the criticism is that Cuyp's study of nature was sincere so far as it went, but was limited in scope and not searching in accuracy. Hence, though he is included among the masters whom Ruskin depreciated (Vol. III. p. 85), yet his merits are not denied (Vol. III. pp. 167, 188). Turner imitated him and to good effect (Vol. V. p. 407; Vol. XII. p. 125); he is one of the "more skilful masters of the Dutch school" (*Fors Clavigera*, Letter 56).]

that I know of; strong; but unhelpful and unthoughtful. Nothing happens in his pictures, except some indifferent person's asking the way of somebody else, who, by his cast of countenance, seems not likely to know it. For farther entertainment perhaps a red cow and a white one; or puppies at play, not playfully; the man's heart not going even with the puppies. Essentially he sees nothing but the shine on the flaps of their ears.

§ 13. Observe always, the fault lies not in the thing's being little, or the incident being slight. Titian could have put issues of life and death into the face of a man asking the way; nay, into the back of him, if he had so chosen. He has put a whole scheme of dogmatic theology into a row of bishops' backs at the Louvre.¹ And for dogs, Velasquez has made some of them nearly as grand as his surly kings.

Into the causes of which grandeur we must look a little, with respect not only to these puppies, and gray horses, and cattle of Cuyp, but to the hunting pieces of Rubens and Snyders. For closely connected with the Dutch rejection of motives of spiritual interest, is the increasing importance attached by them to animals, seen either in the chase or in agriculture; and to judge justly of the value of this animal painting, it will be necessary for us to glance at that of earlier times.

§ 14. And first of the animals which have had more influence over the human soul, in its modern life, than ever Apis or the crocodile had over Egyptian—the dog and horse. I stated, in speaking of Venetian religion, that the Venetians always introduced the dog as a contrast to the high aspects of humanity.² They do this, not because they consider him the basest of animals, but the highest—the connecting link between men and animals; in whom the lower forms of really human feeling may be best exemplified,

¹ [The reference is to No. 1586, "The Council of Trent," a picture now often ascribed to Andrea Schiavone.]

² [See above, ch. iii. § 22 (p. 292).]

such as conceit, gluttony, indolence, petulance. But they saw the noble qualities of the dog, too;—all his patience, love, and faithfulness; therefore Veronese, hard as he is often on lap-dogs, has painted one great heroic poem on the dog.

§ 15. Two mighty brindled mastiffs, and beyond them, darkness.¹ You scarcely see them at first, against the gloomy green. No other sky for them—poor things. They are gray themselves, spotted with black all over; their multitudinous doggish vices may not be washed out of them,—are in grain of nature. Strong thewed and sinewed, however,—no blame on them as far as bodily strength may reach; their heads coal-black, with drooping ears and fierce eyes, bloodshot a little. Wildest of beasts perhaps they would have been, by nature. But between them stands the spirit of their human love, dove-winged and beautiful, the resistless Greek boy, golden quivered; his glowing breast and limbs the only light upon the sky,—purple and pure. He has cast his chain about the dogs' necks, and holds it in his strong right hand, leaning proudly a little back from them. They will never break loose.

§ 16. This is Veronese's highest, or spiritual view of the dog's nature. He can only give this when looking at the creature alone. When he sees it in company with men, he subdues it, like an inferior light in presence of the sky; and generally then gives it a merely brutal nature, not insisting even on its affection. It is thus used in the *Marriage in Cana* to symbolize gluttony. That great picture I have not yet had time to examine in all its bearings of thought;² but the chief purpose of it is, I believe, to express the pomp and pleasure of the world, pursued without thought of the presence of Christ; therefore the Fool with the bells is put in the centre, immediately underneath the Christ; and in front are the couple of dogs in leash, one

¹ [This picture is in the Munich Gallery: "The Winged Cupid with Dogs."]

² [For Ruskin's study of this picture in 1849 and 1854, see "Notes on the Louvre" (Vol. XII, pp. 451, 452, 456, and 473 (on which latter page the incident of the cat is noticed).]

gnawing a bone. A cat lying on her back scratches at one of the vases which hold the wine of the miracle.

§ 17. In the picture of *Susannah*,¹ her little pet dog is merely doing his duty, barking at the Elders. But in that of the *Magdalen* (at *Turin*)² a noble piece of bye-meaning is brought out by a dog's help. On one side is the principal figure, the *Mary* washing *Christ's* feet; on the other, a dog has just come out from beneath the table (the dog under the table eating of the crumbs), and in doing so, has touched the robe of one of the *Pharisees*, thus making it unclean. The *Pharisee* gathers up his robe in a passion, and shows the hem of it to a bystander, pointing to the dog at the same time.

§ 18. In the *Supper at Emmaus*,³ the dog's affection is, however, fully dwelt upon. *Veronese's* own two little daughters are playing, on the hither side of the table, with a great wolf-hound, larger than either of them. One with her head down, nearly touching his nose, is talking to him—asking him questions it seems, nearly pushing him over at the same time:—the other raising her eyes, half archly, half dreamily,—some far-away thought coming over her,—leans against him on the other side, propping him with her little hand, laid slightly on his neck. He, all passive, and glad at heart, yielding himself to the pushing or sustaining hand, looks earnestly into the face of the child close to his; would answer her with the gravity of a senator, if so it might be:—can only look at her, and love her.

§ 19. To *Velasquez* and *Titian* dogs seem less interesting than to *Veronese*; they paint them simply as noble brown beasts, but without any special character; perhaps *Velasquez's* dogs are sterner and more threatening than the *Venetian's*, as are also his kings and admirals. This fierceness in the animal increases, as the spiritual power of the artist declines;

¹ [In the *Louvre*: see Vol. XII. pp. 455, 460.]

² [One of the three large *Veroneses* referred to above: see Introduction, p. xxxviii.]

³ [Again in the *Louvre*: see Vol. XII. p. 451, where the two little girls and the dog are also noted.]

and, with the fierceness, another character. One great and infallible sign of the absence of spiritual power is the presence of the slightest taint of obscenity. Dante marked this strongly in all his representations of demons,¹ and as we pass from the Venetians and Florentines to the Dutch, the passing away of the soul-power is indicated by every animal becoming savage or foul. The dog is used by Teniers, and many other Hollanders, merely to obtain unclean jest; while by the more powerful men, Rubens, Snyders, Rembrandt,² it is painted only in savage chase, or butchered agony. I know no pictures more shameful to humanity than the boar and lion hunts of Rubens and Snyders, signs of disgrace all the deeper, because the powers desecrated are so great. The painter of the village ale-house sign may, not dishonourably, paint the fox-hunt for the village squire; but the occupation of magnificent art-power in giving semblance of perpetuity to those bodily pangs which Nature has mercifully ordained to be transient, and in forcing us, by the fascination of its stormy skill, to dwell on that from which eyes of merciful men should instinctively turn away, and eyes of high-minded men scornfully, is dishonourable, alike in the power which it degrades, and the joy to which it betrays.

§ 20. In our modern treatment of the dog, of which the prevailing tendency is marked by Landseer, the interest taken in him is disproportionate to that taken in man, and leads to a somewhat trivial mingling of sentiment, or warping by caricature; giving up the true nature of the animal for the sake of a pretty thought or pleasant jest. Neither Titian nor Velasquez ever jests; and though Veronese jests gracefully and tenderly, he never for an instant oversteps the absolute facts of nature.³ But the English painter looks for sentiment or jest primarily, and reaches

¹ [This statement is perhaps too sweeping. Hints of obscenity on the part of devils or the damned occur, however, in *Inferno*, xxi. 140, and xxv. 1-3.]

² [On Rembrandt's wild beasts, compare the *Review of Lord Lindsay*, § 55 (Vol. XII. p. 226); and compare (for Rubens and Snyders also) *Pre-Raphaelitism*, § 27 (Vol. XII. p. 363).]

³ [On this subject, compare the discussion of the Grotesque in the preceding volume (Vol. VI. p. 470).]

both by a feebly romantic taint of fallacy, except in one or two simple and touching pictures, such as the Shepherd's Chief Mourner.¹

I was pleased by a little unpretending modern German picture at Düsseldorf, by E. Bosch,² representing a boy carving a model of his sheep-dog in wood; the dog sitting on its haunches in front of him, watches the progress of the sculpture with a grave interest and curiosity, not in the least caricatured, but highly humorous. Another small picture, by the same artist, of a forester's boy being taught to shoot by his father,—the dog critically and eagerly watching the raising of the gun,—shows equally true sympathy.

§ 21. I wish I were able to trace any of the leading circumstances in the ancient treatment of the horse, but I have no sufficient data. Its function in the art of the Greeks is connected with all their beautiful fable philosophy; but I have not a tithe of the knowledge necessary to pursue the subject in this direction. It branches into questions relating to sacred animals, and Egyptian and Eastern mythology. I believe the Greek interest in *pure* animal character corresponded closely to our own, except that it is less sentimental, and either distinctly true or distinctly fabulous; not hesitating between truth and falsehood. Achilles' horses, like Anacreon's dove, and Aristophanes' frogs and birds, speak clearly out, if at all. They do not become feebly human by fallacies and exaggerations, but frankly and wholly.

Zeuxis' picture of the Centaur indicates, however, a more distinctly sentimental conception;³ and I suppose the Greek

¹ [For a description of this picture, see *Modern Painters*, vol. i. (Vol. III. pp. 88–89). A summary of Ruskin's references to Landseer is given at Vol. IV. p. 334.]

² [Ernest Bosch, born at Crefeld, 1834; moved to Düsseldorf, 1851 (see A. Seubert's *Allgemeines Künstlerlexicon*, 1878, vol. i. p. 155). The former of the two pictures here described is again mentioned in *Eagle's Nest*, § 88. For other references to the *genre* of the Düsseldorf School, see *Academy Notes*, 1858, 1875 (Vol. XIV. pp. 252, 279).]

³ [In the first draft § 21 was shorter, thus:—

“The Greeks, doing everything rightly which they desired to do at all, treated their sculpture of horses with care proportioned to the need

artists always to have fully appreciated the horse's fineness of temper and nervous constitution.* They seem, by the way, hardly to have done justice to the dog. My pleasure in the entire *Odyssey* is diminished because Ulysses gives not a word of kindness or of regret to Argus.¹

§ 22. I am still less able to speak of Roman treatment of the horse. It is very strange that in the chivalric ages he is despised; their greatest painters drawing him with ludicrous neglect.² The Venetians, as was natural,³ painted him little and ill; but he becomes important in the equestrian statues of the fifteenth and sixteenth centuries,⁴ chiefly, I suppose, under the influence of Leonardo.

* "A single harsh word will raise a nervous horse's pulse ten beats a minute."—Mr. Rarey.⁵

of it, for the better display of human power or beauty. The account of the picture of the Centaur family indicates a tendency on the part of their painters to a sentimental interest in animals, while closely correspondent in conception to Veronese's poem on the dog, though much more daring. We have, moreover, the beautiful fable of the prophecy of his horse to Achilles, but I have not knowledge enough to pursue the inquiry . . . Eastern mythology."

In his later studies of Greek art, Ruskin gave some notes on the treatment of the horse in sculpture: see *Aratra Pentelici*, § 179. For passing notes on the Greek treatment of the horse, on the coins of Tarentum, see also *Cestus of Aglaia*, § 42; and as a type of a crested sea-wave, *Queen of the Air*, § 13.

The picture of the Centaur by Zeuxis is described by Lucian (*Zeuxis*, 3). The subject was a "Female Centaur nursing two young Centaurs." She was represented lying on the grass, with one foot raised; she was holding up to her human breast one of the two young Centaurs to suckle it, while the other was sucking, like a foal at a mare. In the upper part of the picture was the male Centaur, smiling on the group below, and holding up a lion cub to frighten his progeny. Lucian highly praises the vividness with which Zeuxis thus portrayed the double nature of Centaurs. For Ruskin's rationalisation of the Centaur myths, see *Aratra*, § 76; and compare *Fors Clavigera*, Letter 9, where also he refers to "the prophecy of his horse to Achilles" (*Iliad*, xix. 404-417). For "Anacreon's dove," see *Anacreontea*, 9.]

¹ [For the recognition of his master after long years by Argus, see *Odyssey*, xix. 300 seq.]

² [In his first draft Ruskin had here made the memorandum, "Examine the picture by Paul Ucello in our own gallery" (for which see above, p. 18, and below, p. 368).]

³ [Compare *Stones of Venice*, vol. ii. ch. viii. § 97 (Vol. X. p. 408).]

⁴ [See, for instance, Ruskin's account of the equestrian statue of Bartolomeo Colleone, Vol. XI. p. 19. Leonardo's studies of horses were numerous (see the reproductions in the work upon him by Eugène Müntz), and his famous cartoon for the "Battle of Anghiari" was full of horsemen.]

⁵ [*The Modern Art of Taming Wild Horses*. By J. S. Rarey (reprinted from the American edition), 1853, p. 55. This is the book referred to by Ruskin in the letter quoted at Vol. XIV. p. 174 n.]

I am not qualified to judge of the merit of the equestrian statues; but, in painting, I find that no real interest is taken in the horse until Vandyck's time, he and Rubens doing more for it than all previous painters put together. Rubens was a good rider, and rode nearly every day,¹ as I doubt not, Vandyck also. Some notice of an interesting equestrian picture of Vandyck's will be found in the next chapter.² The horse has never, I think, been painted worthily again, since he died.* Of the influence of its unworthy painting, and unworthy use, I do not at present care to speak, noticing only that it brought about in England the last degradations of feeling and of art. The Dutch, indeed, banished all Deity from the earth;³ but I think only in England has death-bed consolation been sought in a fox's tail.†

I wish, however, the reader distinctly to understand that the expressions of reprobation of field-sports which he will find scattered through these volumes,—and which, in concluding them, I wish I had time to collect⁵ and farther enforce,—refer only to the chase and the turf; that is to

* John Lewis has made grand sketches of the horse, but has never, so far as I know, completed any of them. Respecting his wonderful engravings of wild animals, see my pamphlet on Pre-Raphaelitism.⁴

† See "The Fox-hunter's Death-bed," a popular sporting print.

¹ ["Rubens rose early; in summer at four o'clock, and immediately afterwards heard mass. He then went to work, and while painting habitually employed a person to read to him from one of the classical authors. . . . An hour before dinner was devoted to recreation. . . . After working again till evening, he usually, if not prevented by business, mounted a spirited Andalusian horse, and rode for an hour or two. This was his favourite exercise; he was extremely fond of horses, and his stables generally contained some of remarkable beauty" (*Original Unpublished Papers Illustrative of the Life of Rubens*, p. 7).]

² [See below, p. 359 n.]

³ [See above, p. 331.]

⁴ [See Vol. XII. p. 363; in which volume, opposite p. 364, one of Lewis's sketches of horses' heads is reproduced.]

⁵ [See Vol. IV. p. 149, where "those accursed sports" are spoken of as gathering "into one continuance of cruelty all the devices that brutes use sparingly;" Vol. V. p. 382, where "the delights of horse-racing and hunting" are cited among the vulgarities of the modern world (see also Vol. VI. p. 416); and in the present volume, p. 14 (where the "slaying of bird and beast" is contrasted with man's work "to dress the earth and to keep it"). In later books Ruskin often reverted to the subject. Thus in the *Crown of Wild Olive*, § 26, he traces the "deadly" consequences

say, to hunting, shooting, and horse-racing, but not to athletic exercises. I have just as deep a respect for boxing, wrestling, cricketing, and rowing, as contempt of all the various modes of wasting wealth, time, land, and energy of soul, which have been invented by the pride and selfishness of men, in order to enable them to be healthy in uselessness, and get quit of the burdens of their own lives, without condescending to make them serviceable to others.

§ 23. Lastly, of cattle.

The period when the interest of men began to be transferred from the ploughman to his oxen is very distinctly marked by Bassano.¹ In him the descent is even greater, being, accurately, from the Madonna to the Manger—one

of the chase and the turf; on the curse of betting he speaks in *Crown of Wild Olive*, § 127; and in *Love's Meinie*, §§ 131 *seq.*, he quotes the passage from Vol. IV., and reaffirms his "knowledge of the bitterness of the curse which the habits of hunting and 'la chasse' have brought upon the so-called upper classes of England." In *Love's Meinie*, § 139, he admits the pursuit of big game "for discipline and trial of courage," but pleads for the preservation of all defenceless animals as in "one vast unwall'd park", and in the *Eagle's Nest*, § 178, he deplores the English aristocracy's idea of caste as being that "its life should be spent in shooting"; with which passage compare *Love's Meinie*, §§ 2, 113. It was characteristic that in his first lecture at Oxford, Ruskin should confess "one of my fondest dreams, that I may succeed in making some of you English youths like better to look at a bird than to shoot it; and even desire to make wild creatures tame, instead of tame creatures wild" (*Lectures on Art*, § 23). In a letter to the *Daily Telegraph* of January 15, 1870 (reprinted in *Arrows of the Chace*, 1880, vol. ii. p. 184, and in a later volume of this edition), he joined in a discussion on the morality of field sports, reprobating them not so much on the ground of cruelty, as on that of their tendency to "waste the time, misapply the energy, debase the taste, and abate the honour of the upper classes" (with which passage compare Vol. VIII. pp. 264-265); see also *Fors Clavigera*, Letters 37, 46, and 51 (Notes and Correspondence). Ruskin notes that he himself was never educated in out-door sports (*Præterita*, ii. § 54), and that his one experience in accompanying a friend on a day's shooting did not incline him to such "fashionable amusement" (*ibid.*, § 196). For Ruskin's tolerance, and even encouragement, of other out-door sports, see *A Joy for Ever*, § 128 (Vol. XVI. p. 111), where he mentions riding, rowing, and cricket as "the most useful things which boys learn at public schools"; *Crown of Wild Olive*, § 23 (on cricket as "play" or "work"); and see also a letter to Mr. Alfred Lyttelton (given in a later volume of this edition). Ruskin's interest in skilful rowing is shown in *Eagle's Nest*, § 12, and in boating generally, in *Præterita*, ii. § 197; in wrestling and fencing, in *Fors Clavigera*, Letter 82 (Notes and Correspondence), and "An Oxford Lecture," § 18. But he felt that much time was wasted even in legitimate sports (see, for instance, *Ariadne Florentina*, § 48), and it was partly in order to encourage a more useful form of exercise that he started the Hincksey diggings at Oxford (see Vol. X. p. 201 n., and the Introduction to a later volume). See also *Munera Pulveris*, § 149.]

¹ [For other references to this painter, see Vol. IV. p. 301, and below, p. 414 n.]

of perhaps his best pictures (now, I believe, somewhere in the north of England),¹ representing an adoration of shepherds with nothing to adore, they and their herds forming the subject, and the Christ "being supposed" at the side. From that time cattle-pieces become frequent, and gradually form a staple art commodity. Cuyp's are the best; nevertheless, neither by him nor any one else have I ever seen an entirely well-painted cow. All the men who have skill enough to paint cattle nobly, disdain them. The real influence of these Dutch cattle-pieces, in subsequent art, is difficult to trace, and is not worth tracing. They contain a certain healthy appreciation of simple pleasure which I cannot look upon wholly without respect. On the other hand, their cheap tricks of composition degraded the entire technical system of landscape; and their clownish and blunt vulgarities too long blinded us, and continue, so far as in them lies, to blind us yet, to all the true refinement and passion of rural life. There have always been truth and depth of pastoral feeling in the works of great poets and novelists; but never, I think, in painting, until lately. The designs of J. C. Hook² are, perhaps, the only works of the kind in existence which deserve to be mentioned in connection with the pastorals of Wordsworth and Tennyson.

We must not, however, yet pass to the modern school, having still to examine the last phase of Dutch design, in which the vulgarities which might be forgiven to the truth of Cuyp, and forgotten in the power of Rubens, became unpardonable and dominant in the works of men who were at once affected and feeble. But before doing this, we must pause to settle a preliminary question, which is an important and difficult one, and will need a separate chapter;—namely, What is vulgarity itself?

¹ [The Adoration of the Shepherds is the subject of a large number of pictures by the painter.]

² [For a summary of Ruskin's references to Hook, see Vol. XIV. p. 9 n.]

CHAPTER VII

OF VULGARITY¹

§ 1. Two great errors, colouring, or rather discolouring, severally, the minds of the higher and lower classes, have sown wide dissension, and wider misfortune, through the society of modern days. These errors are in our modes of interpreting the word "gentleman."²

Its primal, literal, and perpetual meaning is "a man of pure race"; well bred, in the sense that a horse or dog is well bred.

The so-called higher classes, being generally of purer race than the lower, have retained the true idea, and the convictions associated with it; but are afraid to speak it out, and equivocate about it in public; this equivocation mainly proceeding from their desire to connect another meaning with it, and a false one;—that of "a man living in idleness on other people's labour";—with which idea the term has nothing whatever to do.

The lower classes, denying vigorously, and with reason, the notion that a gentleman means an idler, and rightly feeling that the more any one works, the more of a gentleman

¹ [For other discussions of Vulgarity, see Vol. V. pp. 117–118, where Ruskin says that it "is only in concealment of truth, or in affectation"; Vol. XIV. p. 243, where it is defined as "the habit of mind and act resulting from the prolonged combination of insensibility with insincerity"; and Vol. XV. p. 205, where the present discussion is promised. See also *Sesame and Lilies*, § 28 ("want of sensation"); and *Fors Clavigera*, Letter 25, where Ruskin refers to the present chapter.]

² [Ruskin discusses the word and its meaning in many other places. See *A Joy for Ever*, § 114 (Vol. XVI. p. 98), where he combats the distinction between "gentleman" and "tradesman" (compare *Pre-Raphaelitism*, § 2, Vol. XII. p. 342). *Sesame and Lilies*, § 30, where he gives as one of the marks of gentlemen that "their feelings are constant and just" (compare *Fiction, Fair and Foul*, §§ 17, 44, and *Præterita*, iii. §§ 77–78); *Crown of Wild Olive*, § 108, where he again connects "gentle" and "of pure race"; "Sir Joshua and Holbein," § 6 n., where he refers to the present passage; and *Fors Clavigera*, Letter 41, where Ruskin enumerates some of the characteristics which distinguish "a gentleman" from "a churl."]

he becomes, and is likely to become,—have nevertheless got little of the good they otherwise might, from the truth, because, with it, they wanted to hold a falsehood,—namely, that race was of no consequence. It being precisely of as much consequence in man as it is in any other animal.

§ 2. The nation cannot truly prosper till both these errors are finally got quit of. Gentlemen have to learn that it is no part of their duty or privilege to live on other people's toil. They have to learn that there is no degradation in the hardest manual, or the humblest servile, labour, when it is honest. But that there *is* degradation, and that deep, in extravagance, in bribery, in indolence, in pride, in taking places they are not fit for, or in coining places for which there is no need. It does not disgrace a gentleman to become an errand boy, or a day labourer; but it disgraces him much to become a knave, or a thief. And knavery is not the less knavery because it involves large interests, nor theft the less theft because it is countenanced by usage, or accompanied by failure in undertaken duty. It is an incomparably less guilty form of robbery to cut a purse out of a man's pocket, than to take it out of his hand on the understanding that you are to steer his ship up channel, when you do not know the soundings.

§ 3. On the other hand, the lower orders, and all orders, have to learn that every vicious habit and chronic disease communicates itself by descent; and that by purity of birth the entire system of the human body and soul may be gradually elevated, or, by recklessness of birth, degraded; until there shall be as much difference between the well-bred and ill-bred human creature (whatever pains be taken with their education) as between a wolf-hound and the vilest mongrel cur. And the knowledge of this great fact ought to regulate the education of our youth, and the entire conduct of the nation.*

* We ought always in pure English to use the term "good breeding" literally; and to say "good nurture" for what we usually mean by good breeding. Given the race and make of the animal, you may turn it to good

§ 4. Gentlemanliness, however, in ordinary parlance, must be taken to signify those qualities which are usually the evidence of high breeding, and which, so far as they can be acquired, it should be every man's effort to acquire; or, if he has them by nature, to preserve and exalt. Vulgarity, on the other hand, will signify qualities usually characteristic of ill-breeding, which, according to his power, it becomes every person's duty to subdue. We have briefly to note what these are.

§ 5. A gentleman's first characteristic is that fineness of structure in the body, which renders it capable of the most delicate sensation; and of structure in the mind which renders it capable of the most delicate sympathies—one may say, simply, "fineness of nature." This is, of course, compatible with heroic bodily strength and mental firmness; in fact, heroic strength is not conceivable without such delicacy.

or bad account; you may spoil your good dog or colt, and make him as vicious as you choose, or break his back at once by ill-usage; and you may, on the other hand, make something serviceable and respectable out of your poor cur and colt if you educate them carefully; but ill-bred they will both of them be to their lives' end; and the best you will ever be able to say of them is, that they are useful, and decently behaved, ill-bred creatures.¹ An error, which is associated with the truth, and which makes it always look weak and disputable, is the confusion of race with name; and the supposition that the blood of a family must still be good, if its genealogy be unbroken and its name not lost, though sire and son have been indulging age after age in habits involving perpetual degeneracy of race. Of course it is equally an error to suppose that, because a man's name is common, his blood must be base; since his family may have been ennobling it by pureness of moral habit for many generations, and yet may not have got any title, or other sign of nobleness, attached to their names. Nevertheless, the probability is always in favour of the race which has had acknowledged supremacy, and in which every motive leads to the endeavour to preserve its true nobility.

¹ [The MS. here inserts: "The old English rough proverb is irrevocably true,—you can make no silk purse of a sow's ear." And at the end of the note continues:—

"And this great truth also holds—though it is a disagreeable one to look full in the face—that, named or nameless, no man can make himself a gentleman who was not born one. If he lives a right life, and cultivates all the powers, and yet more all the sensibilities, he is born with, and chooses his wife well, his own son will be more a gentleman than he is, and he may see yet better blood than his son's in his grandchild's cheeks, but he must be content to remain a clown himself—if he was born a clown."]

Elephantine strength may drive its way through a forest and feel no touch of the boughs; but the white skin of Homer's Atrides¹ would have felt a bent rose-leaf, yet subdue its feeling in glow of battle, and behave itself like iron. I do not mean to call an elephant a vulgar animal; but if you think about him carefully, you will find that his non vulgarity consists in such gentleness as is possible to elephantine nature; not in his insensitive hide, nor in his clumsy foot; but in the way he will lift his foot if a child lies in his way; and in his sensitive trunk, and still more sensitive mind, and capability of pique on points of honour.

§ 6. And, though rightness of moral conduct is ultimately the great purifier of race, the sign of nobleness is not in this rightness of moral conduct, but in sensitive-ness. When the make of the creature is fine, its temptations are strong, as well as its perceptions; it is liable to all kinds of impressions from without in their most violent form; liable therefore to be abused and hurt by all kinds of rough things which would do a coarser creature little harm, and thus to fall into frightful wrong if its fate will have it so. Thus David, coming of gentlest as well as royalest race, of Ruth as well as of Judah, is sensitiveness through all flesh and spirit; not that his compassion will restrain him from murder when his terror urges him to it; nay, he is driven to the murder all the more by his sensitiveness to the shame which otherwise threatens him. But when his own story is told under a disguise, though only a lamb is now concerned, his passion about it leaves him no time for thought. "The man shall die"—note the reason—"because he had no pity."² He is so eager and indignant that it never occurs to him as strange that Nathan hides the name. This is true gentleman. A vulgar man would assuredly have been cautious, and asked who it was.

§ 7. Hence it will follow that one of the probable signs

¹ [For this reference to Menelaus (*Iliad*, iv. 141 seq.), compare *Modern Painters*, vol. iii. (Vol. V. p. 198).]

² [2 Samuel xii. 5, 6.]

of high-breeding in men generally, will be their kindness and mercifulness; these always indicating more or less fineness of make in the mind; and miserliness and cruelty the contrary; hence that of Isaiah: "The vile person shall no more be called liberal, nor the churl said to be bountiful."¹ But a thousand things may prevent this kindness from displaying or continuing itself; the mind of the man may be warped so as to bear mainly on his own interests, and then all his sensibilities will take the form of pride, or fastidiousness, or revengefulness; and other wicked, but not ungentlemanly tempers; or, farther, they may run into utter sensuality and covetousness. if he is bent on pleasure, accompanied with quite infinite cruelty when the pride is wounded or the passions are thwarted;—until your gentleman becomes Fizzelin, and your lady, the deadly Lucrece;² yet still gentleman and lady, quite incapable of making anything else of themselves, being so born.

§ 8. A truer sign of breeding than mere kindness is therefore sympathy;—a vulgar man may often be kind in a hard way, on principle, and because he thinks he ought to be; whereas, a highly-bred man, even when cruel, will be cruel in a softer way, understanding and feeling what he inflicts, and pitying his victim.³ Only we must carefully remember that the quantity of sympathy a gentleman feels can never be judged of by its outward expression, for another of his chief characteristics is apparent reserve. I say "apparent" reserve; for the sympathy is real, but the reserve not: a perfect gentleman is never reserved, but sweetly and entirely open, so far as it is good for others, or possible, that he should be. In a great many respects it is impossible that he should be open except to men of his own kind. To them, he can open himself, by a word or

¹ [Isaiah xxxii. 5.]

² [For Ezzelin, see Vol. XII. p. 137 n. For Lucrezia Borgia, *Two Paths*, § 187 (Vol. XVI. p. 404).]

³ [Here the MS. adds:—

"Methinks one would love Bayard better in being wounded by him even to the death than one would love any other man, though he held us to ransom."]

syllable, or a glance; but to men not of his kind he cannot open himself, though he tried it through an eternity of clear grammatical speech. By the very acuteness of his sympathy he knows how much of himself he can give to anybody; and he gives that much frankly;—would always be glad to give more if he could, but is obliged, nevertheless, in his general intercourse with the world, to be a somewhat silent person; silence is to most people, he finds, less reserve than speech. Whatever he said, a vulgar man would misinterpret: no words that he could use would bear the same sense to the vulgar man that they do to him; if he used any, the vulgar man would go away saying, "He had said so and so, and meant so and so" (something assuredly he never meant): but he keeps silence, and the vulgar man goes away saying, "He didn't know what to make of him." Which is precisely the fact, and the only fact which he is anywise able to announce to the vulgar man concerning himself.

§ 9. There is yet another quite as efficient cause of the apparent reserve of a gentleman. His sensibility being constant and intelligent, it will be seldom that a feeling touches him, however acutely, but it has touched him in the same way often before, and in some sort is touching him always. It is not that he feels little, but that he feels habitually; a vulgar man having some heart at the bottom of him, if you can by talk or by sight fairly force the pathos of anything down to his heart, will be excited about it and demonstrative; the sensation of pity being strange to him and wonderful. But your gentleman has walked in pity all day long; the tears have never been out of his eyes; you thought the eyes were bright only; but they were wet. You tell him a sorrowful story, and his countenance does not change; the eyes can but be wet still: he does not speak neither, there being, in fact, nothing to be said, only something to be done; some vulgar person, beside you both, goes away saying, "How hard he is!" Next day he hears that the hard person has put good end to the sorrow he said nothing

about;—and then he changes his wonder, and exclaims, “How reserved he is!”

§ 10. Self-command is often thought a characteristic of high-breeding; and to a certain extent it is so, at least it is one of the means of forming and strengthening character; but it is rather a way of imitating a gentleman than a characteristic of him; a true gentleman has no need of self-command; he simply feels rightly on all occasions; and desiring to express only so much of his feeling as it is right to express, does not need to command himself. Hence perfect ease is indeed characteristic of him; but perfect ease is inconsistent with self-restraint. Nevertheless gentlemen, so far as they fail of their own ideal, need to command themselves, and do so; while, on the contrary, to feel unwisely, and to be unable to restrain the expression of the unwise feeling, is vulgarity; and yet even then, the vulgarity, at its root, is not in the mistimed expression, but in the unseemly feeling; and when we find fault with a vulgar person for “exposing himself,” it is not his openness, but clumsiness; and yet more the want of sensibility to his own failure, which we blame; so that still the vulgarity resolves itself into want of sensibility. Also, it is to be noted that great powers of self-restraint may be attained by very vulgar persons when it suits their purposes.

§ 11. Closely, but strangely, connected with this openness is that form of truthfulness which is opposed to cunning, yet not opposed to falsity absolute. And herein is a distinction of great importance.

Cunning signifies especially a habit or gift of over-reaching, accompanied with enjoyment and a sense of superiority. It is associated with small and dull conceit, and with an absolute want of sympathy or affection. Its essential connection with vulgarity may be at once exemplified by the expression of the butcher’s dog in Landseer’s “*Low Life*.”¹ Cruikshank’s “*Noah Claypole*,” in the illustrations to *Oliver*

¹ [“*High Life and Low Life*” is No. 410 in the Tate Gallery.]

Twist, in the interview with the Jew,¹ is, however, still more characteristic. It is the intensest rendering of vulgarity absolute and utter with which I am acquainted.*

The truthfulness which is opposed to cunning ought, perhaps, rather to be called the desire of truthfulness; it consists more in unwillingness to deceive than in not deceiving,—an unwillingness implying sympathy with and respect for the person deceived; and a fond observance of truth up to the possible point, as in a good soldier's mode of retaining his honour through a *ruse-de-guerre*. A cunning person seeks for opportunities to deceive; a gentleman shuns them. A cunning person triumphs in deceiving; a gentleman is humiliated by his success, or at least by so much of the success as is dependent merely on the falsehood, and not on his intellectual superiority.

§ 12. The absolute disdain of all lying belongs rather to Christian chivalry than to mere high-breeding; as connected merely with this latter, and with general refinement and courage, the exact relations of truthfulness may be best studied in the well-trained Greek mind. The Greeks believed that mercy and truth were co-relative virtues—cruelty and falsehood, co-relative vices. But they did not call necessary severity, cruelty; nor necessary deception, falsehood. It was needful sometimes to slay men, and sometimes to deceive them. When this had to be done, it should be done well and thoroughly; so that to direct a spear well to its mark, or a lie well to its end, was

* Among the reckless losses of the right service of intellectual power with which this century must be charged, very few are, to my mind, more to be regretted than that which is involved in its having turned to no higher purpose than the illustration of the career of Jack Sheppard, and of the Irish Rebellion, the great, grave (I use the words deliberately and with large meaning), and singular genius of Cruikshank.²

¹ [The illustration to ch. xlii., called "The Jew and Morris Bolter begin to understand each other" (compare *Fiction, Fair and Foul*, § 29).]

² [Instead of this note the MS. has :—

"The characters of the Dodger in *Oliver Twist* and of Mrs. Gamp are equally valuable illustrations in their way."

For Ruskin's estimate of Cruikshank, compare Vol. VI. p. 471 n.; Vol. XIII. p. 504 n.]

equally the accomplishment of a perfect gentleman. Hence, in the pretty diamond-cut-diamond scene between Pallas and Ulysses, when she receives him on the coast of Ithaca, the goddess laughs delightedly at her hero's good lying, and gives him her hand upon it;—showing herself then in her woman's form, as just a little more than his match. “Subtle would he be, and stealthy, who should go beyond thee in deceit, even were he a god, thou many-witted! What! here in thine own land, too, wilt thou not cease from cheating? Knowest thou not me, Pallas Athena, maid of Jove, who am with thee in all thy labours, and gave thee favour with the Phæacians, and keep thee, and have come now to weave cunning with thee?”¹ But how completely this kind of cunning was looked upon as a part of a man's power, and not as a diminution of faithfulness, is perhaps best shown by the single line of praise in which the high qualities of his servant are summed up by Chremulus in the *Plutus*—“Of all my house servants, I hold you to be the faithfullest, and the greatest cheat (or thief).”²

§ 13. Thus, the primal difference between honourable and base lying in the Greek mind lay in honourable purpose. A man who used his strength wantonly to hurt others was a monster; so, also, a man who used his cunning wantonly to hurt others. Strength and cunning were to be used only in self-defence, or to save the weak, and then were alike admirable. This was their first idea. Then the second, and perhaps the more essential, difference between noble and ignoble lying in the Greek mind, was that the honourable lie—or, if we may use the strange, yet just, expression, the true lie—knew and confessed itself for such—was ready to take the full responsibility of what it did. As the sword answered for its blow, so the lie for its snare. But

¹ [*Odyssey*, xiii. 291–303.]

² [Aristophanes, *Plutus*, 26, 27. In his own copy Ruskin notes at the side of this passage, “Conf. *Theognis*, 712.” The author of the *Maxims* there says that “to the multitude of men there is no virtue except to be rich; of the rest there is no use . . . not even though you should be as wise as Rhadamanthus . . . nor if you could make falsehoods like to truths, having the skilful tongue of the god-like Nestor.”]

what the Greeks hated with all their heart was the false lie;—the lie that did not know itself, feared to confess itself, which slunk to its aim under a cloak of truth, and sought to do liars' work, and yet not take liars' pay, excusing itself to the conscience by quibble and quirk. Hence the great expression of Jesuit principle by Euripides, "The tongue has sworn, but not the heart," was a subject of execration throughout Greece, and the satirists exhausted their arrows on it—no audience was ever tired of hearing (τὸ Εὐριπίδειον ἐκέينو) "that Euripidean thing" brought to shame.¹

§ 14. And this is especially to be insisted on in the early education of young people. It should be pointed out to them with continual earnestness that the essence of lying is in deception, not in words: a lie may be told by silence, by equivocation, by the accent on a syllable, by a glance of the eye attaching a peculiar significance to a sentence; and all these kinds of lies are worse and baser by many degrees than a lie plainly worded; so that no form of blinded conscience is so far sunk as that which comforts itself for having deceived, because the deception was by gesture or silence, instead of utterance; and, finally, according to Tennyson's deep and trenchant line, "A lie which is half a truth is ever the worst of lies."²

§ 15. Although, however, ungenerous cunning is usually so distinct an outward manifestation of vulgarity, that I name it separately from insensibility, it is in truth only an effect of insensibility, producing want of affection to others,

¹ [The original line (quite innocent in its context)—ἡ γλῶσσ' δμῳμοχ', ἡ δὲ φρήν ἀνώματος—is in the *Hippolytus* (612). It is referred to as τὸ Εὐριπίδειον ἐκέينو by Lucian (*Sale of Lives*, ch. 9), and is parodied by Aristophanes in the *Frogs*, 101 and 1471, and *Theophrastus*, 275. It is also quoted by Plato (*Theæt.* 154 D, and *Symp.* 199 A), and by other authors.]

² [*The Grandmother*. Compare what Ruskin says in *Fors Clavigera*, Letter 76, about "all the worst of falsehoods" having "one little kernel of distorted truth in the heart" of them. For other passages in which the ethics of lying are discussed, see *Seven Lamps* (Vol. VIII. p. 55), on "the guilt and harm of amiable and well-meant lying"; *ibid.*, p. 242 n. ("parody—the most loathsome manner of falsehood"); *Modern Painters*, vol. i. (Vol. III. p. 137), "all falsehood a blot as well as a sin" (compare *ibid.*, vol. iv. (Vol. VI. p. 474); *Crown of Wild Olive*, § 186 ("there are lies and lies"—a reference, again, to the *Odyssey*).]

and blindness to the beauty of truth. The degree in which political subtlety in men such as Richelieu, Machiavel, or Metternich, will efface the gentleman, depends on the selfishness of political purpose to which the cunning is directed, and on the base delight taken in its use. The command, "Be ye wise as serpents, harmless as doves,"¹ is the ultimate expression of this principle, misunderstood usually because the word "wise" is referred to the intellectual power instead of the subtlety of the serpent. The serpent has very little intellectual power, but according to that which it has, it is yet, as of old, the subtlest of the beasts of the field.²

§ 16. Another great sign of vulgarity is also, when traced to its root, another phase of insensibility, namely, the undue regard to appearances and manners, as in the households of vulgar persons, of all stations, and the assumption of behaviour, language, or dress unsuited to them, by persons in inferior stations of life. I say "undue" regard to appearances, because in the undueness consists, of course, the vulgarity. It is due and wise in some sort to care for appearances, in another sort undue and unwise. Wherein lies the difference?

At first one is apt to answer quickly: the vulgarity is simply in pretending to be what you are not. But that answer will not stand. A queen may dress like a waiting-maid,—perhaps succeed, if she chooses, in passing for one; but she will not, therefore, be vulgar; nay, a waiting-maid may dress like a queen, and pretend to be one, and yet need not be vulgar, unless there is inherent vulgarity in her. In Scribe's very absurd but very amusing *Reine d'un jour*, a milliner's girl sustains the part of a queen for a day. She several times amazes and disgusts her courtiers by her straightforwardness; and once or twice very nearly betrays herself to her maids of honour by an unqueenly knowledge of sewing; but she is not in the least vulgar,

¹ [Matthew x. 16.]

² [Genesis iii. 1.]

for she is sensitive, simple, and generous, and a queen could be no more.

§ 17. Is the vulgarity, then, only in trying to play a part you cannot play, so as to be continually detected? No; a bad amateur actor may be continually detected in his part, but yet continually detected to be a gentleman: a vulgar regard to appearances has nothing in it necessarily of hypocrisy. You shall know a man not to be a gentleman by the perfect and neat pronunciation of his words: but he does not pretend to pronounce accurately; he *does* pronounce accurately, the vulgarity is in the real (not assumed) scrupulousness.

§ 18. It will be found on farther thought, that a vulgar regard for appearances is, primarily, a selfish one, resulting not out of a wish to give pleasure (as a wife's wish to make herself beautiful for her husband), but out of an endeavour to mortify others, or attract for pride's sake;—the common "keeping up appearances" of society, being a mere selfish struggle of the vain with the vain.¹ But the deepest stain of the vulgarity depends on this being done, not selfishly only, but stupidly, without understanding the impression which is really produced, nor the relations of importance between oneself and others, so as to suppose that their attention is fixed upon us, when we are in reality ciphers in their eyes—all which comes of insensibility. Hence pride simple is not vulgar (the looking down on others because of their true inferiority to us), nor vanity simple (the desire of praise), but conceit simple (the attribution to ourselves of qualities we have not) is always so. In cases of over-studied pronunciation, etc., there is insensibility, first, in the person's thinking more of himself than of what he is saying; and, secondly, in his not having musical fineness of ear enough to feel that his talking is uneasy and strained.

§ 19. Finally, vulgarity is indicated by coarseness of

¹ [Compare *Sesame and Lilies*, §§ 2-5.]

language or manners, only so far as this coarseness has been contracted under circumstances not necessarily producing it. The illiterateness of a Spanish or Calabrian peasant is not vulgar, because they had never an opportunity of acquiring letters; but the illiterateness of an English school-boy is. So again, provincial dialect is not vulgar; but cockney dialect, the corruption, by blunted sense, of a finer language continually heard, is so in a deep degree; and again, of this corrupted dialect, that is the worst which consists, not in the direct or expressive alteration of the form of a word, but in an unmusical destruction of it by dead utterance and bad or swollen formation of lip. There is no vulgarity in—

“Blythe, b'lythe, blythe was she,
Blythe was she, but and ben,
And weel she liked a Hawick gill,
And leugh to see a tappit hen;”¹

but much in Mrs. Gamp's inarticulate “bottle on the chimley-piece, and let me put my lips to it when I am so disposed.”²

§ 20. So also of personal defects, those only are vulgar which imply insensibility or dissipation.

There is no vulgarity in the emaciation of Don Quixote, the deformity of the Black Dwarf, or the corpulence of Falstaff; but much in the same personal characters, as they are seen in Uriah Heep, Quilp, and Chadband.

§ 21. One of the most curious minor questions in this matter is respecting the vulgarity of excessive neatness, complicating itself with inquiries into the distinction between base neatness, and the perfectness of good execution in the fine arts. It will be found on final thought

¹ [“The Song of Andro and his Cutty Gun;” given in Joseph Ritson's *Scottish Songs*, 1794, vol. i. p. 268. “But and ben,” in either room of the house. “Tappit hen” means, first, a hen sitting on her eggs; see “The Laird of Cockpen,” *ad fin.* For its meaning as a vessel containing three quarts of claret, see Scott's note (“H.”) to *Guy Mannering* (where he quotes the lines in the text): “It was,” he says, “a pewter measure, the claret being in ancient days served from the tap, and had the figure of a hen upon the lid.”]

² [*Martin Chuzzlewit*, ch. xix.]

that precision and exquisiteness of arrangement are always noble; but become vulgar only when they arise from an equality (insensibility) of temperament, which is incapable of fine passion, and is set ignobly, and with a dullard mechanism, on accuracy in vile things. In the finest Greek coins, the letters of the inscriptions are purposely coarse and rude, while the reliefs are wrought with inestimable care.¹ But in an English coin, the letters are the best done, and the whole is unredeemably vulgar. In a picture of Titian's, an inserted inscription will be complete in the lettering, as all the rest is; because it costs Titian very little more trouble to draw rightly than wrongly, and in him, therefore, impatience with the letters would be vulgar, as in the Greek sculptor of the coin, patience would have been. For the engraving of a letter accurately* is difficult work, and his time must have been unworthily thrown away.

* There is this farther reason also: "Letters are always ugly things"—(*Seven Lamps*, chap. iv. s. 9).² Titian often wanted a certain quantity of ugliness to oppose his beauty with, as a certain quantity of black to oppose his colour. He could regulate the size and quantity of inscription as he liked; and, therefore, made it as neat—that is, as effectively ugly—as possible. But the Greek sculpture could not regulate either size or quantity of inscription. Legible it must be, to common eyes, and contain an assigned group of words. He had more ugliness than he wanted, or could endure. There was nothing for it but to make the letters themselves rugged and picturesque; to give them, that is, a certain quantity of organic variety.

I do not wonder at people sometimes thinking I contradict myself when they come suddenly on any of the scattered passages, in which I am forced to insist on the opposite practical applications of subtle principles of this kind.³ It may amuse the reader, and be finally serviceable to him in showing him how necessary it is to the right handling of any subject, that these contrary statements should be made, if I assemble here the

¹ [See, for a fuller discussion of the comparative rudeness of such inscriptions, *Queen of the Air*, § 170; the passage forms part of an address, there reprinted, on "The Hercules of Camarina"—one of several notices of Greek coins which occur in Ruskin's later writings (see especially *Aratra Pentelici*, *passim*).]

² [See in this edition, Vol. VIII. p. 147 and n.]

³ [On this subject, see Vol. V. pp. liii.-liv., where a passage is quoted from one of Ruskin's diaries on the many-sidedness of truth. See also the passage quoted in Vol. XI. pp. xvii.-xxi., where he describes at length the apparent contradictions into which the combating of opposite errors may lead. For references to passages in which he remarks upon his own self-contradictions, see Vol. V. p. liv. n.]

§ 22. All the different impressions connected with negligence or foulness depend, in like manner, on the degree of insensibility implied. Disorder in a drawing-room is vulgar, in an antiquary's study, not; the black battle-stain on a soldier's face is not vulgar, but the dirty face of a housemaid is.

principal ones I remember having brought forward, bearing on this difficult point of precision in execution.

It would be well if you would first glance over the chapter on Finish in the third volume;¹ and if, coming to the fourth paragraph, about gentlemen's carriages, you have time to turn to Sydney Smith's *Memoirs* and read his account of the construction of the "Immortal," it will furnish you with an interesting illustration.

The general conclusion reached in that chapter being that finish, for the sake of added truth, or utility, or beauty, is noble; but finish, for the sake of workmanship, neatness, or polish, ignoble,—turn to the fourth chapter of the *Seven Lamps*, where you will find the Campanile of Giotto given as the model and mirror of perfect architecture, just on account of its exquisite completion.² Also, in the next chapter, I expressly limit the delightfulness of rough and imperfect work to developing and unformed schools (pp. 142–143, 1st edition); then turn to the 170th page of the *Stones of Venice*, Vol. II., and you will find this directly contrary statement:—

"No good work whatever can be perfect, and the demand for perfection is always a sign of a misunderstanding of the ends of art." . . . "The first cause of the fall of the arts in Europe was a relentless requirement of perfection" (p. 172). By reading the intermediate text, you will be put in possession of many good reasons for this opinion; and, comparing it with that just cited about the Campanile of Giotto, will be brought, I hope, into a wholesome state of not knowing what to think.

Then turn to p. 167, where the great law of finish is again maintained as strongly as ever: "Delicate finish (finish—that is to say, up to the point possible) is always desirable from the greatest masters, and is always given by them."—(Vol. II. chap. vi. § 19.)

And lastly, if you look to § 19 of the chapter on the Early Renaissance,

¹ [In this edition, Vol. V. p. 152, where it is said that it is not an ignoble disposition "which would induce a country gentleman to put up with certain deficiencies in the appearance of his country-made carriage." Sydney Smith's account of his home-made chariot, which he christened the *Immortal*, is at vol. i. p. 161 of his *Memoirs*. In the MS. Ruskin added a footnote to the footnote, as follows:—

"There is no man of our modern time—not even Wordsworth (for Wordsworth has no humour)—to whose character, principles, and written opinions I pay respect so entire and unhesitating as I do to Sydney Smith's, so far as I can read or hear of them."

With this tribute to Sydney Smith, compare the letter from Ruskin given in S. J. Reid's *Life and Times of Sydney Smith*, p. 374, and reprinted in a later volume of this edition; see also *Cestus of Aglaia*, § 113; "My First Editor," § 15; *Præterita*, i. § 131; ii. §§ 54, 165–166; iii. § 62.]

² [In this edition, Vol. VIII. p. 189. The following references are in this edition to Vol. VIII. p. 198; Vol. X. pp. 202, 204, 199; Vol. XI. pp. 17, 32.]

And lastly, courage, so far as it is a sign of race, is peculiarly the mark of a gentleman or a lady: but it becomes vulgar if rude or insensitive, while timidity is not vulgar, if it be a characteristic of race or fineness of make. A fawn is not vulgar in being timid, nor a crocodile "gentle" because courageous.

§ 23. Without following the inquiry into farther detail,*

Vol. III., you will find the profoundest respect paid to completion; and, at the close of that chapter, § 38, the principle is resumed very strongly. "*As ideals of executive perfection*, these palaces are most notable among the architecture of Europe, and the Rio façade of the Ducal palace, as an example of finished masonry in a vast building, is one of the finest things, not only in Venice, but in the world."

Now all these passages are perfectly true; and, as in much more serious matters, the essential thing for the reader is to receive their truth, however little he may be able to see their consistency. If truths of apparently contrary character are candidly and rightly received, they will fit themselves together in the mind without any trouble. But no truth maliciously received will nourish you, or fit with others. The clue of connection may in this case, however, be given in a word. Absolute finish is always right; finish, inconsistent with prudence and passion, wrong. The imperative demand for finish is ruinous, because it refuses better things than finish. The stopping short of the finish, which is honourably possible to human energy, is destructive on the other side, and not in less degree. Err, of the two, on the side of completion.

* In general illustration of the subject, the following extract from my private diary possesses some interest.¹ It refers to two portraits which happened to be placed opposite to each other in the arrangement of a gallery; one, modern, of a (foreign) general on horseback at a review; the other,

¹ [Ruskin's diary of 1858 was written (see above, Introduction, p. xxvii.) in the form of letters to his father. This extract is from a letter dated Turin, July 28, 1858, which adds:—

"There are two pictures hung opposite to each other in the farthest or innermost room at this Gallery, which have been set there, it seems, with definite purpose of illustrating what is noble and what is vulgar in the most striking way. One is a Vandyck, the Prince Thomas of Savoja-Carignano on horseback; the other a Horace Vernet, the late King of Sardinia, Charles Albert, at a review."

Almost all the rest of the letter is given (with some slight alterations) in the passage here; the original letter having been used as "copy" for the book (among the MS. of which it still remains). Ruskin had friends among the Turinese, and was thus anxious not to connect his type of vulgarity with Vernet's picture of Charles Albert; hence his mystification in the text of describing the subject of Vandyck's portrait as "an ancestor of his family," and that of Vernet's as simply "a general." "General" is substituted throughout for "the King" or "the King of Sardinia," and "the Knight" for "the Prince of Carignano"; "the modern painter" for "Vernet," and so forth. The two pictures are no longer hung together.]

we may conclude that vulgarity consists in a deadness of the heart and body, resulting from prolonged, and especially from inherited conditions of "degeneracy," or literally "un-racing";—gentlemanliness, being another word for an intense humanity. And vulgarity shows itself primarily in dulness of heart, not in rage or cruelty, but in inability to feel or conceive noble character or emotion. This is its essential,

by Vandyck, also an equestrian portrait, of an ancestor of his family, whom I shall here simply call "the knight":

"I have seldom seen so noble a Vandyck, chiefly because it is painted with less flightiness and flimsiness than usual, with a grand quietness and reserve—almost like Titian. The other is, on the contrary, as vulgar and base a picture as I have ever seen, and it becomes a matter of extreme interest to trace the cause of the difference.

"In the first place, everything the general and his horse wear is evidently just made. It has not only been cleaned that morning, but has been sent home from the tailor's in a hurry last night. Horse bridle, saddle housings, blue coat, stars and lace thereupon, cocked hat, and sword hilt—all look as if they had just been taken from a shopboard in Pall Mall; the irresistible sense of the coat having been brushed to perfection is the first sentiment which the picture summons. The horse has also been rubbed down all the morning, and shines from head to tail.

"The knight rides in a suit of rusty armour. It has evidently been polished also carefully, and gleams brightly here and there; but all the polishing in the world will never take the battle-dints and battle-darkness out of it. His horse is gray, not lustrous, but a dark, lurid gray. Its mane is deep and soft; part of it shaken in front over its forehead—the rest, in enormous masses of waving gold, six feet long, falls streaming on its neck, and rises in currents of softest light, rippled by the wind over the rider's armour. The saddle cloth is of a dim red, fading into leathern brown, gleaming with sparkles of obscure gold. When, after looking a little while at the soft mane of the Vandyck horse, we turn back to the general's, we are shocked by the evident coarseness of its hair, which hangs, indeed, in long locks over the bridle, but is stiff, crude, sharp pointed, coarsely coloured (a kind of buff); no fine drawing of nostril or neck can give any look of nobleness to the animal which carries such hair; it looks like a hobby horse with tow glued to it, which riotous children have half pulled or scratched out. The next point of difference is the isolation of Vandyck's figure, compared with the modern painter's endeavour to ennoble his by subduing others. The knight seems to be just going out of his castle gates; his horse rears as he passes their pillars; there is nothing behind, but the sky. But the general is reviewing a regiment; the ensign lowers his colours to him; he takes off his hat in return. All which reviewing and bowing is in its very nature ignoble, wholly unfit to be painted: a gentleman might as well be painted leaving his card on somebody. And, in the next place, the modern painter has thought to enhance his officer by putting the regiment some distance back and in the shade,

pure, and most fatal form. Dulness of bodily sense and general stupidity, with such forms of crime as peculiarly issue from stupidity, are its material manifestation.

§ 24. Two years ago, when I was first beginning to work out the subject, and chatting with one of my keenest-minded friends¹ (Mr. Brett, the painter of the Val d'Aosta in the Exhibition of 1859), I casually asked him, "What is vulgarity?" merely to see what he would say, not supposing

so that the men look only about five feet high, being besides very ill painted to keep them in better subordination. One does not know whether most to despise the feebleness of the painter who must have recourse to such an artifice, or his vulgarity in being satisfied with it.² I ought by the way, before leaving the point of dress, to have noted that the vulgarity of the painter is considerably assisted by the vulgarity of the costume itself. Not only is it base in being new, but base in that it cannot last to be old. If one wanted a lesson on the ugliness of modern costume, it could not be more sharply received than by turning from one to the other horseman. The knight wears steel plate armour, chased here and there with gold; the delicate, rich, pointed lace collar falling on the embossed breastplate; his dark hair flowing over his shoulders; a crimson silk scarf fastened round his waist, and floating behind him; buff boots, deep folded at the instep, set in silver stirrup. The general wears his hair cropped short; blue coat, padded and buttoned; blue trowsers and red stripe; black shiny boots; common saddler's stirrups; cocked hat in hand, suggestive of absurd completion, when assumed.

"Another thing noticeable as giving nobleness to the Vandyck is its feminineness; the rich, light silken scarf, the flowing hair, the delicate, sharp, though sunburnt features, and the lace collar, do not in the least diminish the manliness, but *add* feminineness. One sees that the knight is indeed a soldier, but not a soldier only; that he is accomplished in all ways, and tender in all thoughts: while the general is represented as nothing but a soldier—and it is very doubtful if he is even that—one is sure, at a glance, that if he can do anything but put his hat off and on, and give words of command, the anything must, at all events, have something to do with the barracks; that there is no grace, nor music, nor softness, nor learnedness, in the man's soul; that he is made up of forms and accoutrements.

"Lastly, the modern picture is as bad painting as it is wretched conceiving; and one is struck, in looking from it to Vandyck's, peculiarly by the fact that good work is always *enjoyed* work.³ There is not a touch of

¹ [This must have been when Ruskin was with Brett in Turin in 1858: see Vol. XIV. p. xxiii.; and for the "Val d'Aosta" (reproduced as frontispiece to that volume), *ibid.*, p. 238 n.]

² [Here the letter adds:—

"It is such a miserable footman's compliment: 'Back all of you. Here's the great man—Mr. Charles Albert, if you please.'"]

³ [Compare *A Joy for Ever*, § 102 (Vol. XVI. p. 87).]

Eden & Co.

Portrait of Prince Tommaso di Savoia-Carignano

Reproduction of the portrait by Vandyck in the Royal Collection, London

it possible to get a sudden answer. He thought for about a minute, then answered quietly, "It is merely one of the forms of Death." I did not see the meaning of the reply at the time; but on testing it, found that it met every phase of the difficulties connected with the inquiry, and summed the true conclusion. Yet, in order to be complete, it ought to be made a distinctive as well as conclusive definition; showing *what* form of death vulgarity is;

Vandyck's pencil but he seems to have revelled in—not grossly, but delicately—tasting the colour in every touch as an epicure would wine. While the other goes on daub, daub, daub, like a bricklayer spreading mortar—nay, with far less lightness of hand or lightness of spirit than a good bricklayer's—covering his canvas heavily and conceitedly at once, caring only but to catch the public eye with his coarse, presumptuous, ponderous, illiterate work."

Thus far my diary. In case it should be discovered by any one where these pictures are, it should be noted that the vulgarity of the modern one is wholly the painter's fault. It implies none in the general (except bad taste in pictures). The same painter would have made an equally vulgar portrait of Bayard. And as for taste in pictures, the general's was not singular. I used to spend much time before the Vandyck; and among all the tourist visitors to the gallery, who were numerous, I never saw one look at it twice, but all paused in respectful admiration before the padded surtout. The reader will find, farther, many interesting and most valuable notes on the subject of nobleness and vulgarity in Emerson's *Essays*,¹ and every phase of nobleness illustrated in Sir Kenelm Digby's *Broad Stone of Honour*. The best help I have ever had—so far as help depended on the sympathy or praise of others in work which, year after year, it was necessary to pursue through the abuse of the brutal and the base—was given me, when this author, from whom I had first learned to love nobleness, introduced frequent reference to my own writings in his *Children's Bower*.²

¹ [See especially the essay entitled "Manners." Ruskin read Emerson with much sympathy: see Vol. V. p. 427 and n.]

² ["Sir" Kenelm Digby in the text is a slip, the reference being, of course, not to the author, naval commander, and diplomatist of the seventeenth century, but to Kenelm Henry Digby (1800-1880), whose *Broad Stone of Honour* appeared in 1822. *The Children's Bower*; or, *What You Like* appeared in 1858 (2 vols.); quotations from Ruskin (referred to as "a great writer," or "a great contemporary") were given at vol. i. pp. 9, 29, 51, 53, 67, 77, 106, 112, 114, 119, 131, 142, 233; vol. ii. p. 185. Ruskin's father on reading the book reported it to his son, who replied:—

"I should think," he wrote from Lauffenbourg (May 27, 1858), "you would rather enjoy the mentions of me in that *Children's Bower*, considering how much we used to enjoy the *Broad Stone*; and I shall be much interested in them myself." "I'm very happy," he writes again (June 6), "about those quotations by the author of the *Broad Stone of Honour*: no man, after Helps, whom I would so much wish to please. Yes, the responsibility is great, but one mustn't work much under the feeling of it, else one would write timidly and ill.]"

for death itself is not vulgar, but only death mingled with life. I cannot, however, construct a short-worded definition which will include all the minor conditions of bodily degeneracy; but the term "deathful selfishness" will embrace all the most fatal and essential forms of mental vulgarity.

CHAPTER VIII

WOUVERMANS AND ANGELICO¹

§ 1. HAVING determined the general nature of vulgarity, we are now able to close our view of the character of the Dutch school.

It is a strangely mingled one, which I have the more difficulty in investigating, because I have no power of sympathy with it. However inferior in capacity, I can enter measuredly into the feelings of Correggio or of Titian; what they like, I like; what they disdain, I disdain.² Going lower down, I can still follow Salvator's passion, or Albano's prettiness; and lower still, I can measure modern German heroics, or French sensualities. I see what the people mean,—know where they are, and what they are. But no effort of fancy will enable me to lay hold of the temper of Teniers, or Wouvermans, any more than I can enter into the feelings of one of the lower animals. I cannot see why they painted,—what they are aiming at,—what they liked or disliked. All their life and work is the same sort of mystery to me as the mind of my dog when he rolls on carrion. He is a well enough conducted dog in other respects, and many of these Dutchmen were doubtless very well-conducted persons: certainly they learned their business well; both Teniers and Wouvermans touch with a workmanly hand, such as we cannot see rivalled now; and they

¹ [The title of this chapter perhaps suggested itself to Ruskin in the Turin Gallery: see above, Introduction, p. xxxix. n.]

² [For Titian, Ruskin's admiration was at this time almost unqualified (see especially *Two Paths*, § 57, Vol. XVI. p. 298). For Correggio, it was severely measured (see Vol. IV. p. 197 n.). For Salvator, see above, ch. iv. For Albano, Vol. XVI. p. 192. For "German heroics," Vol. V. pp. 100, 430; and compare the Introduction, above, p. liii. For "French sensualities," Vol. IV. p. 63 n.; and for the Dutch painters, see General Index.]

seem never to have painted indolently, but gave the purchaser his thorough money's worth of mechanism, while the burgesses who bargained for their cattle and card parties were probably more respectable men than the princes who gave orders to Titian for nymphs, and to Raphael for nativities. But whatever patient merit or commercial value may be in Dutch labour, this at least is clear, that it is wholly insensitive.

The very mastery these men have of their business proceeds from their never really seeing the whole of anything, but only that part of it which they know how to do. Out of all nature they felt their function was to extract the grayness and shininess. Give them a golden sunset, a rosy dawn, a green waterfall, a scarlet autumn on the hills, and they merely look curiously into it to see if there is anything gray and glittering which can be painted on their common principles.

§ 2. If this, however, were their only fault, it would not prove absolute insensibility, any more than it could be declared of the makers of Florentine tables,¹ that they were blind or vulgar, because they took out of nature only what could be represented in agate. A Dutch picture is, in fact, merely a Florentine table more finely touched; it has its regular ground of slate, and its mother-of-pearl and tinsel put in with equal precision; and perhaps the fairest view one can take of a Dutch painter, is that he is a respectable tradesman furnishing well-made articles in oil paint; but when we begin to examine the designs of these articles, we may see immediately that it is his inbred vulgarity, and not the chance of fortune, which has made him a tradesman, and kept him one;—which essential character of Dutch work, as distinguished from all other, may be best seen in that hybrid landscape, introduced by Wouvermans and Berghem. Of this landscape Wouvermans' is the most characteristic. It will be remembered that I called it "hybrid,"

¹ [Compare *A Joy for Ever*, § 34 (Vol. XVI. p. 38).]

because it strove to unite the attractiveness of every other school.¹ We will examine the motives of one of the most elaborate Wouvermans existing—landscape with a hunting party, No. 208 in the Pinacothek of Munich.²

§ 3. A large lake in the distance narrows into a river in the foreground; but the river has no current, nor has the lake either reflections or waves. It is a piece of gray slate table, painted with horizontal touches, and only explained to be water by boats upon it. Some of the figures in these are fishing (the corks of a net are drawn in bad perspective); others are bathing, one man pulling his shirt over his ears, others are swimming. On the farther side of the river are some curious buildings, half villa, half ruin; or rather ruin dressed. There are gardens at the top of them, with beautiful and graceful trellised architecture and wandering tendrils of vine. A gentleman is coming down from a door in the ruins to get into his pleasure-boat. His servant catches his dog.

§ 4. On the nearer side of the river, a bank of broken ground rises from the water's edge up to a group of very graceful and carefully studied trees, with a French-antique statue on a pedestal in the midst of them, at the foot of which are three musicians, and a well-dressed couple dancing; their coach is in waiting behind. In the foreground are hunters. A richly and highly dressed woman with falcon on fist, the principal figure in the picture, is wrought with Wouvermans' best skill. A stouter lady rides into the water after a stag and hind, who gallop across the middle of the river without sinking. Two horsemen attend the two Amazons, of whom one pursues the game cautiously, but the other is thrown headforemost into the river, with a splash which shows it to be deep at the edge. though the hart and hind find bottom in the middle. Running footmen, with other dogs, are coming up, and children are

¹ [See above, p. 255.]

² ["A Stag Hunt," No. 496 in a subsequent renumbering. See Ruskin's note upon the picture which is given below, p. 493; and compare the Introduction, pp. liii.-liv.]

sailing a toy-boat in the immediate foreground. The tone of the whole is dark and gray, throwing out the figures in spots of light, on Wouvermans' usual system. The sky is cloudy, and very cold.

§ 5. You observe that in this picture the painter has assembled all the elements which he supposes pleasurable. We have music, dancing, hunting, boating, fishing, bathing, and child-play, all at once. Water, wide and narrow; architecture, rustic and classical; trees also of the finest; clouds, not ill-shaped. Nothing wanting to our Paradise: not even practical jest; for to keep us always laughing, somebody shall be for ever falling with a splash into the Pison. Things proceed, nevertheless, with an oppressive quietude. The dancers are uninterested in the hunters, the hunters in the dancers; the hirer of the pleasure-boat perceives neither hurt nor hind; the children are unconcerned at the hunter's fall; the bathers regard not the draught of fishes; the fishers fish among the bathers, without apparently anticipating any diminution in their haul.

§ 6. Let the reader ask himself, would it have been possible for the painter in any clearer way to show an absolute, clay-cold, ice-cold incapacity of understanding what a pleasure meant? Had he had as much heart as a minnow, he would have given some interest to the fishing; with the soul of a grasshopper, some spring to the dancing; had he half the will of a dog, he would have made some one turn to look at the hunt, or given a little fire to the dash down to the water's edge. If he had been capable of pensiveness, he would not have put the pleasure-boat under the ruin;—capable of cheerfulness, he would not have put the ruin above the pleasure-boat. Paralyzed in heart and brain, he delivers his inventoried articles of pleasure one by one to his ravenous customers; palateless; gluttonous. "We cannot taste it. Hunting is not enough; let us have dancing. That's dull; now give us a jest, or what is life! The river is too narrow, let us have a lake; and, for mercy's sake, a pleasure-boat, or how can we spend another minute of this

languid day! But what pleasure can be in a boat? let us swim; we see people always drest, let us see them naked."

§ 7. Such is the unredeemed, carnal appetite for mere sensual pleasure. I am aware of no other painter who consults it so exclusively, without one gleam of higher hope, thought, beauty, or passion.

As the pleasure of Wouvermans, so also is his war. That, however, is not hybrid, it is of one character only.

The best example I know is the great battle-piece with the bridge, in the gallery of Turin. It is said that when this picture, which had been taken to Paris, was sent back, the French offered twelve thousand pounds (300,000 francs) for permission to keep it. The report, true or not, shows the estimation in which the picture is held at Turin.¹

§ 8. There are some twenty figures in the *mêlée* whose faces can be seen (about sixty in the picture altogether), and of these twenty, there is not one whose face indicates courage or power; or anything but animal rage and cowardice; the latter prevailing always. Every one is fighting for his life, with the expression of a burglar defending himself at extremity against a party of policemen. There is the same terror, fury, and pain which a low thief would show on receiving a pistol-shot through his arm. Most of them appear to be fighting only to get away; the standard-bearer *is* retreating, but whether with the enemy's flag or his own I do not see; he slinks away with it, with reverted eye, as if he were stealing a pocket-handkerchief. The swordsmen cut at each other with clenched teeth and terrified eyes; they are too busy to curse each other; but one sees that the feelings they have could be expressed no otherwise than by low oaths. Far away, to the smallest

¹ [In the description of the picture sent by Ruskin to his father among the "Notes on the Turin Gallery" (see above, p. xxxix.), he mentions this story as one current among the Italian painters. The description here given follows the "Notes" with some corrections, which add:—

"As a moral lesson against war it would be very valuable if it were properly engraved; only failing from its giving nothing but the base side of battle. I don't believe that there was ever a battle, even in Holland, where nobody but cowards fought."]

figures in the smoke, and to one drowning under the distant arch of the bridge, all are wrought with a consummate skill in vulgar touch; there is no good painting, properly so called, anywhere, but of clever, dotty, sparkling, telling execution, as much as the canvas will hold, and much delicate gray and blue colour in the smoke and sky.

§ 9. Now, in order fully to feel the difference between this view of war, and a gentleman's, go, if possible, into our National Gallery, and look at the young Malatesta riding into the battle of Sant' Egidio (as he is painted by Paul Uccello).¹ His uncle Carlo, the leader of the army, a grave man of about sixty, has just given orders for the knights to close: two have pushed forward with lowered lances, and the *mêlée* has begun only a few yards in front; but the young knight, riding at his uncle's side, has not yet put his helmet on, nor intends doing so yet. Erect he sits, and quiet, waiting for his captain's order to charge; calm as if he were at a hawking party, only more grave; his golden hair wreathed about his proud white brow, as about a statue's.

§ 10. "Yes," the thoughtful reader replies, "this may be pictorially very beautiful; but those Dutchmen were good fighters, and generally won the day; whereas, this very battle of Sant' Egidio, so calmly and bravely begun, was lost."

Indeed, it is very singular that unmitigated expressions of cowardice in battle should be given by the painters of so brave a nation as the Dutch. Not but that it is possible enough for a coward to be stubborn, and a brave man weak; the one may win his battle by a blind persistence, and the other lose it by a thoughtful vacillation. Nevertheless, the want of all expression of resoluteness in Dutch battle-pieces remains, for the present, a mystery to me. In those of Wouvermans, it is only a natural development of his perfect vulgarity in all respects.

§ 11. I do not think it necessary to trace farther the

¹ [See above, pp. 18, 339 n.]

evidences of insensitive conception in the Dutch school. I have associated the name of Teniers with that of Wouvermans in the beginning of this chapter, because Teniers is essentially the painter of the pleasures of the ale-house and card-table, as Wouvermans of those of the chase; and the two are leading masters of the peculiar Dutch trick of white touch on gray or brown ground; but Teniers is higher in reach and more honest in manner. Berghem is the real associate of Wouvermans in the hybrid school of landscape. But all three are alike insensitive; that is to say, unspiritual or deathful, and that to the uttermost, in every thought, —producing, therefore, the lowest phase of possible art of a skilful kind.¹ There are deeper elements in De Hooghe and Gerard Terburg; sometimes expressed with superb quiet painting by the former;² but the whole school is inherently mortal to all its admirers; having by its influence in England destroyed our perception of all purposes of painting, and throughout the north of the Continent effaced the sense of colour among artists of every rank.

We have, last, to consider what recovery has taken place from the paralysis to which the influence of this Dutch art had reduced us in England seventy years ago. But, in closing my review of older art, I will endeavour to illustrate, by four simple examples, the main directions of its spiritual power, and the cause of its decline.

§ 12. The frontispiece of this volume is engraved from an old sketch of mine, a pencil outline of the little Madonna by Angelico, in the Annunciation preserved in the sacristy of Santa Maria Novella.³ This Madonna has not, so far as I know, been engraved before, and it is one of the most

¹ [The MS. adds here:—

“Feeble gleams of truer feeling, but with much inferior painting, occur in the works of Hobbima, Ruysdael, Both, etc., of any of whom, however, with respect to ideas of relation we need take no further notice.”]

² [For other references to De Hooghe, see Vol. V. p. 407, and Vol. XII. p. 455. For notes on pictures by Terburg at Munich, see below, Appendix IV., p. 494.]

³ [Sketched by Ruskin in 1845: see the description of the picture in Vol. IV. p. 263 n. For other references to the Plate, see *Love's Meinie*, § 148, and *The Three Colours of Pre-Raphaelitism*, § 6.]

characteristic of the Purist school. I believe through all my late work I have sufficiently guarded my readers from over-estimating this school;¹ but it is well to turn back to it now, from the wholly carnal work of Wouvermans, in order to feel its purity: so that, if we err, it may be on this side. The opposition is the most accurate which I can set before the student, for the technical disposition of Wouvermans, in his search after delicate form and minute grace, much resembles that of Angelico. But the thoughts of Wouvermans are wholly of this world. For him there is no heroism, awe, or mercy, hope, or faith. Eating and drinking, and slaying; rage and lust; the pleasures and distresses of the debased body—from these, his thoughts, if so we may call them, never for an instant rise or range.

§ 13. The soul of Angelico is in all ways the precise reverse of this; habitually as incognizant of any earthly pleasure as Wouvermans of any heavenly one. Both are exclusive with absolute exclusiveness;—neither desiring nor conceiving anything beyond their respective spheres. Wouvermans lives under gray clouds, his lights come out as spots. Angelico lives in an unclouded light: his shadows themselves are colour; his lights are not the spots, but his darks. Wouvermans lives in perpetual tumult—tramp of horse—clash of cup—ring of pistol-shot. Angelico in perpetual peace. Not seclusion from the world. No shutting out of the world is needful for him. There is nothing to shut out. Envy, lust, contention, discourtesy, are to him as though they were not; and the cloister walk of Fiesole no penitential solitude, barred from the stir and joy of life, but a possessed land of tender blessing, guarded from the entrance of all but holiest sorrow. The little cell was as one of the houses of heaven prepared for him by his Master.

¹ [In his earlier work Ruskin had estimated the school more highly, citing Angelico at the end of the second volume of *Modern Painters* in a climax of admiration (Vol. IV. p. 332). Then, in later volumes, he dwelt rather on the element of weakness in the Purist school: see, for instance, *Stones of Venice*, vol. ii. (p. 226), and *Modern Painters*, vol. iii. (Vol. V. pp. 104–105). At a later period Ruskin reverted in some measure to his earlier view: see *Fors Clavigera*, Letter 76, and Vol. XIII. p. 625, and compare the Introduction, above, pp. xi., xli.]

What need had it to be elsewhere? Was not the Val d'Arno, with its olive woods in white blossom, paradise enough for a poor monk? or could Christ be indeed in heaven more than here? Was He not always with him? Could he breathe or see, but that Christ breathed beside him, and looked into his eyes? Under every cypress avenue the angels walked; he had seen their white robes, whiter than the dawn, at his bed-side, as he awoke in early summer. They had sung with him, one on each side, when his voice failed for joy at sweet vesper and matin time; his eyes were blinded by their wings in the sunset, when it sank behind the hills of Luni.

There may be weakness in this, but there is no baseness; and while I rejoice in all recovery from monasticism which leads to practical and healthy action in the world, I must, in closing this work, severely guard my pupils from the thought that sacred rest may be honourably exchanged for selfish and mindless activity.

§ 14. In order to mark the temper of Angelico, by a contrast of another kind, I give in Fig. 99 a facsimile of one of the heads in Salvator's etching of the Academy of Plato.¹ It is accurately characteristic of Salvator, showing, by quite a central type, his indignant, desolate, and degraded power. I could have taken unspeakably baser examples from others of his etchings, but they would have polluted my book, and been in some sort unjust, representing only the worst part of his work. This head, which is as elevated a type as he ever reaches, is assuredly debased enough; and a sufficient image of the mind of the painter of Catiline and the Witch of Endor.

Fig. 99

§ 15. Then, in Fig. 100 (overleaf), you have also a

¹ [For another reference to this Plate, see above, p. 89 and Fig. 58. The picture of "Catiline" is in the Pitti Palace, Florence; the "Witch of Endor," in the Louvre; for another reference to it, see Vol. X. p. 126.]

central type of the mind of Dürer.¹ Complete, yet quaint; severely rational and practical, yet capable of the highest imaginative religious feeling, and as gentle as a child's, it seemed to be well represented by this figure of the old bishop, with all the infirmities, and all the victory, of his life, written on his calm, kind, and worldly face. He has been no dreamer, nor persecutor, but a helpful and undeceivable man; and by careful comparison of this conception with the common kinds of episcopal ideal in modern religious art, you will gradually feel how the force of Dürer is joined with an unapproachable refinement, so that he can give the most practical view of whatever he treats, without the slightest taint or shadow of vulgarity. Lastly, the fresco of Giorgione, Plate 79,² which is as fair a type as I am able to give in any single figure, of the central Venetian art, will complete for us a series, sufficiently symbolical of the several ranks of art, from lowest to highest.* In Wouvermans (of whose work I suppose no example is needed, it being so generally known), we have the entirely

* As I was correcting these pages, there was put into my hand a little work by a very dear friend—*Travels and Study in Italy*, by Charles Eliot Norton;—I have not yet been able to do more than glance at it; but my impression is, that by carefully reading it, together with the essay by the same writer on the *Vita Nuova* of Dante, a more just estimate may be formed of the religious art of Italy, than by the study of any other books yet existing. At least, I have seen none in which the tone of thought was at once so tender and so just.³

I had hoped, before concluding this book, to have given it higher value by extracts from the works which have chiefly helped or guided me, especially from the writings of Helps, Lowell, and the Rev. A. J. Scott.⁴ But if I were to begin making such extracts, I find that I should not know, either in justice or affection, how to end.

¹ [St. Arnolph, Bishop of Metz.]

² [For the particulars of this Plate, see below, p. 439 n.]

³ [For Ruskin's meeting with Professor Norton in Switzerland in 1856 and their subsequent friendship, see above, Introduction, p. xxii. Mr. Norton's *Notes of Travel and Study in Italy* was published at Boston in 1860; the "New Life" of Dante, an essay, with translations, at Cambridge (U.S.A.) in 1859. Ruskin refers to the latter in one of his letters to Norton (Boston, 1904, vol. i. pp. 97, 170) reprinted in a later volume of this edition.]

⁴ [For Ruskin's indebtedness to Helps, see Vol. V. pp. 153, 334, 427, and Vol. XI. p. 153: see also above, p. 313 n. For Lowell, see above, Introduction, p. xxii.; and below, p. 451. See also *Elements of Drawing*, § 258 (Vol. XV. p. 227); *Time and*

carnal mind,—wholly versed in the material world, and incapable of conceiving any goodness or greatness whatsoever.

In Angelico, you have the entirely spiritual mind, wholly versed in the heavenly world, and incapable of conceiving any wickedness or vileness whatsoever.

In Salvator, you have an awakened conscience, and some spiritual power, contending with evil, but conquered by it, and brought into captivity to it.

In Dürer, you have a far purer conscience and higher spiritual power, yet, with some defect still in intellect, contending with evil, and nobly prevailing over it; yet retaining the marks of the contest, and never so entirely victorious as to conquer sadness.

In Giorgione, you have the same high spiritual power and practical sense; but now, with entirely perfect intellect, contending with evil; conquering it utterly, casting it away for ever, and rising beyond it into magnificence of rest.

Tide, § 140; *Val d'Arno*, § 170; and *Præterita*, iii. § 47. The Rev. Alexander John Scott (1805–1866) was an assistant in London to Edward Irving, and afterwards minister of a congregation at Woolwich; Professor of English Literature at University College, London, and first Principal of the Owens College, Manchester. He was the author of many devotional books. He was a relation of F. J. Shields, the artist, to whom Ruskin wrote: “In Mr. Scott you have a quite infallible guide in intellectual matters.”]

CHAPTER IX

THE TWO BOYHOODS

§ 1. BORN half-way between the mountains and the sea—that young George of Castelfranco—of the Brave Castle:—Stout George they called him, George of Georges, so goodly a boy he was—Giorgione.¹

Have you ever thought what a world his eyes opened on—fair, searching eyes of youth? What a world of mighty life, from those mountain roots to the shore;—of loveliest life, when he went down, yet so young, to the marble city—and became himself as a fiery heart to it?

A city of marble, did I say? nay, rather a golden city, paved with emerald. For truly, every pinnacle and turret glanced or glowed, overlaid with gold, or bossed with jasper. Beneath, the unsullied sea drew in deep breathing, to and fro, its eddies of green wave. Deep-hearted, majestic, terrible as the sea,—the men of Venice moved in sway of power and war; pure as her pillars of alabaster, stood her mothers and maidens; from foot to brow, all noble, walked her knights; the low bronzed gleaming of sea-rusted armour shot angrily under their blood-red mantle-folds. Fearless, faithful, patient, impenetrable, implacable,—every word a fate—sate her senate. In hope and honour, lulled by flowing of wave around their isles of sacred sand, each with his name written and the cross graved at his side, lay her dead. A wonderful piece of world. Rather, itself a world. It lay along the face of the waters, no larger, as its captains saw it from their masts at evening, than a bar of sunset that

¹ [For a rhymed version of a portion of this chapter, see above, Introduction, p. lxvi.]

could not pass away ; but for its power, it must have seemed to them as if they were sailing in the expanse of heaven, and this a great planet, whose orient edge widened through ether. A world from which all ignoble care and petty thoughts were banished, with all the common and poor elements of life. No foulness, nor tumult, in those tremulous streets, that filled, or fell, beneath the moon ; but rippled music of majestic change, or thrilling silence. No weak walls could rise above them ; no low-roofed cottage, nor straw-built shed. Only the strength as of rock, and the finished setting of stones most precious. And around them, far as the eye could reach, still the soft moving of stainless waters, proudly pure ; as not the flower, so neither the thorn nor the thistle, could grow in the glancing fields. Ethereal strength of Alps, dreamlike, vanishing in high procession beyond the 'Torcellan shore ; blue islands of Paduan hills, poised in the golden west. Above, free winds and fiery clouds ranging at their will ;—brightness out of the north, and balm from the south, and the stars of the evening and morning clear in the limitless light of arched heaven and circling sea.¹

Such was Giorgione's school—such Titian's home.

§ 2. Near the south-west corner of Covent Garden, a square brick pit or well is formed by a close-set block of houses, to the back windows of which it admits a few rays of light. Access to the bottom of it is obtained out of Maiden Lane, through a low archway and an iron gate ; and if you stand long enough under the archway to accustom your eyes to the darkness you may see on the left hand a narrow door, which formerly gave quiet access to a respectable barber's shop, of which the front window, looking into Maiden Lane, is still extant, filled, in this year (1860), with

¹ [§ 1, down to this point, was quoted by Ruskin as the conclusion of his Epilogue (1881), entitled "Castelfranco," to *The Stones of Venice* ("Travellers' Edition") : see Vol. XI. p. 244. The last seven lines were also quoted in the Appendix to *The Art of England* (§ 199) as expressing "the beautiful and healthy states of natural cloud and light to which the plague-cloud and plague-wind of the succeeding æra were to be opposed."]

a row of bottles, connected, in some defunct manner, with a brewer's business.¹ A more fashionable neighbourhood, it is said, eighty years ago than now—never certainly a cheerful one—wherein a boy being born on St. George's day, 1775, began soon after to take interest in the world of Covent Garden, and put to service such spectacles of life as it afforded.

§ 3. No knights to be seen there, nor, I imagine, many beautiful ladies; their costume at least disadvantageous, depending much on incumbency of hat and feather, and short waists; the majesty of men founded similarly on shoebuckles and wigs;—impressive enough when Reynolds will do his best for it; but not suggestive of much ideal delight to a boy.

"Bello ovile dov' io dormii agnello";² of things beautiful, besides men and women, dusty sunbeams up or down the street on summer mornings; deep furrowed cabbage-leaves at the greengrocer's; magnificence of oranges in wheelbarrows round the corner; and 'Thames' shore within three minutes' race.

§ 4. None of these things very glorious; the best, however, that England, it seems, was then able to provide for a boy of gift: who, such as they are, loves them—never, indeed, forgets them. The short waists modify to the last his visions of Greek ideal. His foregrounds had always a succulent cluster or two of greengrocery at the corners. Enchanted oranges gleam in Covent Gardens of the Hesperides; and great ships go to pieces in order to scatter chests of them on the waves.³ That mist of early sunbeams in the London dawn crosses, many and many a time, the clearness of Italian air; and by 'Thames' shore, with its

¹ [The region described by Ruskin has been cleared and rebuilt since he wrote. Turner's house (No. 26) was on the north side of the lane (now rebuilt). Woodcuts showing the old house are given in Thornbury's *Life* (facing p. 1), and in Cosmo Monkhouse's *Turner*, p. 11. A few of the older houses still (1905) stand on the south side of the street.]

² [Dante's allusion to Florence: *Paradiso*, xx. 5.]

³ [See "The Garden of the Hesperides," No. 477 in the National Gallery; and "The Meuse: Orange-Merchantman going to pieces on the Bar," No. 501.]

stranded barges and glidings of red sail, dearer to us than Lucerne lake or Venetian lagoon,—by 'Thames' shore we will die.¹

§ 5. With such circumstance round him in youth, let us note what necessary effects followed upon the boy. I assume him to have had Giorgione's sensibility (and more than Giorgione's, if that be possible) to colour and form. I tell you farther, and this fact you may receive trustfully, that his sensibility to human affection and distress was no less keen than even his sense for natural beauty—heart-sight deep as eyesight.

Consequently, he attaches himself with the faithfullest child-love to everything that bears an image of the place he was born in. No matter how ugly it is,—has it anything about it like Maiden Lane, or like 'Thames' shore? If so, it shall be painted for their sake. Hence, to the very close of life, Turner could endure ugliness which no one else, of the same sensibility, would have borne with for an instant. Dead brick walls, blank square windows, old clothes, market-womanly types of humanity—anything fishy and muddy, like Billingsgate or Hungerford Market, had great attraction for him; black barges, patched sails, and every possible condition of fog.

§ 6. You will find these tolerations and affections guiding or sustaining him to the last hour of his life; the notablest of all such endurances being that of dirt. No Venetian ever draws anything foul; but Turner devoted picture after picture to the illustration of effects of dinginess, smoke, soot, dust, and dusty texture; old sides of boats, weedy roadside vegetation, dung-hills, straw-yards, and all the soilings and stains of every common labour.²

And more than this, he not only could endure, but enjoyed and looked for *litter*, like Covent Garden wreck after the market. His pictures are often full of it, from

¹ [For Turner's death at Chelsea, see Vol. XII. p. 133.]

² [Compare the summary of Turner's subjects in this kind in *Pre-Raphaelitism*, § 34 (Vol. XII. p. 369).]

side to side; their foregrounds differ from all others in the natural way that things have of lying about in them. Even his richest vegetation, in ideal work, is confused; and he delights in shingle, débris, and heaps of fallen stones. The last words he ever spoke to me about a picture were in gentle exultation about his St. Gothard: "that *litter* of stones which I endeavoured to represent."¹

§ 7. The second great result of this Covent Garden training was, understanding of and regard for the poor, whom the Venetians, we saw, despised; whom, contrarily, Turner loved, and more than loved—understood. He got no romantic sight of them, but an infallible one, as he prowled about the end of his lane, watching night effects in the wintry streets; nor sight of the poor alone, but of the poor in direct relations with the rich. He knew, in good and evil, what both classes thought of, and how they dealt with, each other.

Reynolds and Gainsborough, bred in country villages, learned there the country boy's reverential theory of "the squire," and kept it. They painted the squire and the squire's lady as centres of the movements of the universe, to the end of their lives.² But Turner perceived the younger squire in other aspects about his lane, occurring prominently in its night scenery, as a dark figure, or one of two, against the moonlight. He saw also the working of city commerce, from endless warehouse, towering over Thames, to the back shop in the lane, with its stale herrings—highly interesting these last; one of his father's best friends, whom he often afterwards visited affectionately at Bristol, being a fishmonger and glue-boiler;³ which gives us a friendly turn of mind towards herring-fishing, whaling, Calais poissardes, and many other of our choicest subjects in after-life; all this being connected with that mysterious

¹ [Said of the drawing of "The Pass of Faido": see Vol. V. p. 122 (and compare Vol. XII. p. 500).]

² [Compare "Sir Joshua and Holbein," §§ 4, 5 (Vol. XIX.); *Ariadne Florentina*, § 48; and *Fors Clavigera*, Letter 45.]

³ [Mr. Narraway, for whom see Vol. XIII. p. 473 n.]

forest below London Bridge on one side; and, on the other, with these masses of human power and national wealth which weigh upon us, at Covent Garden here, with strange compression, and crush us into narrow Hand Court.

§ 8. "That mysterious forest below London Bridge"¹—better for the boy than wood of pine, or grove of myrtle. How he must have tormented the watermen, beseeching them to let him crouch anywhere in the bows, quiet as a log, so only that he might get floated down there among the ships, and round and round the ships, and with the ships, and by the ships, and under the ships, staring, and clambering;—these the only quite beautiful things he can see in all the world, except the sky; but these, when the sun is on their sails, filling or falling, endlessly disordered by sway of tide and stress of anchorage, beautiful unspeakably; which ships also are inhabited by glorious creatures—red-faced sailors, with pipes, appearing over the gunwales, true knights, over their castle parapets—the most angelic beings in the whole compass of London world. And Trafalgar happening long before we can draw ships, we, nevertheless, coax all current stories out of the wounded sailors, do our best at present to show Nelson's funeral streaming up the Thames;² and vow that Trafalgar shall have its tribute of memory some day. Which, accordingly, is accomplished—once, with all our might, for its death; twice, with all our might, for its victory; thrice, in pensive farewell to the old *Téméraire*, and with it, to that order of things.³

§ 9. Now this fond companying with sailors must have

¹ [See *Harbours of England*, § 18 (Vol. XIII. p. 28).]

² ["Turner most likely was at Margate on the 22nd of December (1805), when the *Victory* arrived there with the body of Nelson" (Thornbury's *Life of Turner*, p. 428).]

³ [The pictures referred to are: (1) "The Battle of Trafalgar, as seen from the mizen starboard shrouds of the *Victory*," exhibited in 1808, and usually called "The Death of Nelson," No. 480 in the National Gallery (see Vol. XIII. p. 170); (2) "The Battle of Trafalgar," painted for George IV., and by him presented to Greenwich Hospital in 1829 (see Vol. XIII. pp. 33, 170); (3) the "*Téméraire*," exhibited in 1839, No. 524 in the National Gallery (see Vol. XIII. pp. 167-172).]

divided his time, it appears to me, pretty equally between Covent Garden and Wapping (allowing for incidental excursions to Chelsea on one side, and Greenwich on the other), which time he would spend pleasantly, but not magnificently, being limited in pocket-money, and leading a kind of "Poor Jack" life on the river.

In some respects, no life could be better for a lad. But it was not calculated to make his ear fine to the niceties of language, nor form his moralities on an entirely regular standard. Picking up his first scraps of vigorous English chiefly at Deptford and in the markets, and his first ideas of female tenderness and beauty among nymphs of the barge and the barrow,—another boy might, perhaps, have become what people usually term "vulgar." But the original make and frame of Turner's mind being not vulgar, but as nearly as possible a combination of the minds of Keats and Dante, joining capricious waywardness, and intense openness to every fine pleasure of sense, and hot defiance of formal precedent, with a quite infinite tenderness, generosity, and desire of justice and truth—this kind of mind did not become vulgar, but very tolerant of vulgarity, even fond of it in some forms; and on the outside, visibly infected by it, deeply enough; the curious result, in its combination of elements, being to most people wholly incomprehensible. It was as if a cable had been woven of blood-crimson silk, and then tarred on the outside. People handled it, and the tar came off on their hands; red gleams were seen through the black underneath, at the places where it had been strained. Was it ochre?—said the world—or red lead?

§ 10. Schooled thus in manners, literature, and general moral principles at Chelsea and Wapping, we have finally to inquire concerning the most important point of all. We have seen the principal differences between this boy and Giorgione, as respects sight of the beautiful, understanding of poverty, of commerce, and of order of battle; then follows another cause of difference in our training—not slight,—the aspect of religion, namely, in the neighbourhood of

Covent Garden. I say the aspect; for that was all the lad could judge by. Disposed, for the most part, to learn chiefly by his eyes, in this special matter he finds there is really no other way of learning. His father had taught him "to lay one penny upon another."¹ Of mother's teaching, we hear of none; of parish pastoral teaching, the reader may guess how much.

§ 11. I chose Giorgione rather than Veronese to help me in carrying out this parallel; because I do not find in Giorgione's work any of the early Venetian monarchist element. He seems to me to have belonged more to an abstract contemplative school. I may be wrong in this; it is no matter;—suppose it were so, and that he came down to Venice somewhat recusant or insentient, concerning the usual priestly doctrines of his day, how would the Venetian religion, from an outer intellectual standing-point, have *looked* to him?

§ 12. He would have seen it to be a religion indisputably powerful in human affairs; often very harmfully so; sometimes devouring widows' houses,² and consuming the strongest and fairest from among the young: freezing into merciless bigotry the policy of the old: also, on the other hand, animating national courage, and raising souls, otherwise sordid, into heroism: on the whole, always a real and great power; served with daily sacrifice of gold, time, and thought; putting forth its claims, if hypocritically, at least in bold hypocrisy, not waiving any atom of them in doubt or fear; and, assuredly, in large measure, sincere, believing in itself, and believed: a goodly system, moreover, in aspect; gorgeous, harmonious, mysterious;—a thing which had either to be obeyed or combated, but could not be scorned. A religion towering over all the city—many-buttressed—luminous in marble stateliness, as the dome of our Lady of Safety shines over the sea; many-voiced, also, giving, over all the eastern

¹ ["His 'Dad,' Turner used to say, never praised him for anything but saving a halfpenny" (Cosmo Monkhouse's *Turner*, p. 10).]

² [Matthew xxiii. 14.]

seas, to the sentinel his watchword, to the soldier his war-cry; and, on the lips of all who died for Venice, shaping the whisper of death.¹

§ 13. I suppose the boy Turner to have regarded the religion of his city also from an external intellectual standing-point.

What did he see in Maiden Lane?

Let not the reader be offended with me: I am willing to let him describe, at his own pleasure, what Turner saw there; but to me, it seems to have been this. A religion maintained occasionally, even the whole length of the lane, at point of constable's staff; but, at other times, placed under the custody of the beadle, within certain black and unstately iron railings of St. Paul's, Covent Garden. Among the wheelbarrows and over the vegetables, no perceptible dominance of religion; in the narrow, disquieted streets, none; in the tongues, deeds, daily ways of Maiden Lane, little. Some honesty, indeed, and English industry, and kindness of heart, and general idea of justice; but faith, of any national kind, shut up from one Sunday to the next, not artistically beautiful even in those Sabbatical exhibitions; its paraphernalia being chiefly of high pews, heavy elocution, and cold grimness of behaviour.

What chiaroscuro belongs to it—(dependent mostly on candlelight),—we will, however, draw, considerably; no goodliness of escutcheon, nor other respectability being omitted, and the best of their results confessed, a meek old woman and a child being let into a pew, for whom the reading by candlelight will be beneficial.*

§ 14. For the rest, this religion seems to him discreditable—discredited—not believing in itself: putting forth its

* *Liber Studiorum*. "Interior of a church." It is worthy of remark that Giorgione and Titian are always delighted to have an opportunity of drawing priests. The English Church may, perhaps, accept it as matter of congratulation that this is the only instance in which Turner drew a clergyman.

¹ [With this sketch of Venetian religion, compare *Stones of Venice*, vol. i. (Vol. IX. pp. 23 seq.).]

authority in a cowardly way, watching how far it might be tolerated, continually shrinking, disclaiming, fencing, finessing; divided against itself, not by stormy rents, but by thin fissures, and splittings of plaster from the walls. Not to be either obeyed, or combated, by an ignorant, yet clear-sighted youth! only to be scorned. And scorned not one whit the less, though also the dome dedicated to *it* looms high over distant winding of the Thames; as St. Mark's campanile rose, for goodly landmark, over mirage of lagoon. For St. Mark ruled over life; the Saint of London over death; St. Mark over St. Mark's Place, but St. Paul over St. Paul's Churchyard.

§ 15. Under these influences pass away the first reflective hours of life, with such conclusion as they can reach. In consequence of a fit of illness, he was taken—I cannot ascertain in what year¹—to live with an aunt, at Brentford; and here, I believe, received some schooling, which he seems to have snatched vigorously; getting knowledge, at least by translation, of the more picturesque classical authors, which he turned presently to use, as we shall see. Hence also, walks about Putney and Twickenham in the summer time acquainted him with the look of English meadow-ground in its restricted states of paddock and park; and with some round-headed appearances of trees, and stately entrances to houses of mark: the avenue at Bushey, and the iron gates and carved pillars of Hampton, impressing him apparently with great awe and admiration; so that in after-life his little country house is,—of all places in the world,—at Twickenham!² Of swans and reedy shores he now learns the soft motion and the green mystery, in a way not to be forgotten.

§ 16. And at last fortune wills that the lad's true life shall begin; and one summer's evening, after various wonderful stage-coach experiences on the north road, which

¹ [It was in 1785, when he was ten years old: see Thornbury's *Life of Turner*, p. 11 (ed. of 1877).]

² [At Sandycombe Lodge: see Vol. XIII. p. 468.]

gave him a love of stage-coaches ever after, he finds himself sitting alone among the Yorkshire hills.* For the first time, the silence of Nature round him, her freedom sealed to him, her glory opened to him. Peace at last; no roll of cart-wheel, nor mutter of sullen voices in the back shop; but curlew-cry in space of heaven, and welling of bell-toned streamlet by its shadowy rock. Freedom at last. Dead-wall, dark railing, fenced field, gated garden, all passed away like the dream of a prisoner; and behold, far as foot or eye can race or range, the moor, and cloud. Loveliness at last. It is here then, among these deserted vales! Not among men. Those pale, poverty-struck, or cruel faces;—that multitudinous, marred humanity—are not the only things that God has made. Here is something He has made which no one has marred. Pride of purple rocks, and river pools of blue, and tender wilderness of glittering trees, and misty lights of evening on immeasurable hills.

§ 17. Beauty, and freedom, and peace; and yet another teacher, graver than these. Sound preaching at last here, in Kirkstall crypt, concerning fate and life. Here, where the dark pool reflects the chancel pillars, and the cattle lie in unhindered rest, the soft sunshine on their dappled bodies, instead of priests' vestments; their white furry hair ruffled a little, fitfully, by the evening wind deep-scented from the meadow thyme.¹

§ 18. Consider deeply the import to him of this, his first sight of ruin, and compare it with the effect of the

* I do not mean that this is his first acquaintance with the country, but the first impressive and touching one, after his mind was formed. The earliest sketches I found in the National collection are at Clifton and Bristol; the next, at Oxford.²

¹ [The early sketch of this subject, on which the Plate in *Liber Studiorum* (published in 1812) was founded, is No. 403 in the National Gallery: see Vol. XIII. p. 254. Ruskin there gives the date as "about 1795," but it is doubtful if Turner went as far North until 1797. The drawing for the *Liber Plate* is No. 484.]

² [On the importance of this first visit to Yorkshire (in 1797) compare Vol. III. pp. 233, 234; Turner had (as his dated pictures show) travelled far and wide in England and Wales already. For the "earliest sketches" at Clifton and Bristol, in the National Gallery, see Vol. XIII. pp. 250-253. An early sketch near Oxford is No. 852 in the same collection (*ibid.*, p. 643).]

architecture that was around Giorgione. There were indeed aged buildings, at Venice, in his time, but none in decay. All ruin was removed, and its place filled as quickly as in our London; but filled always by architecture loftier and more wonderful than that whose place it took, the boy himself happy to work upon the walls of it;¹ so that the idea of the passing away of the strength of men and beauty of their works never could occur to him sternly. Brighter and brighter the cities of Italy had been rising and broadening on hill and plain, for three hundred years. He saw only strength and immortality, could not but paint both; conceived the form of man as deathless, calm with power, and fiery with life.

§ 19. Turner saw the exact reverse of this. In the present work of men, meanness, aimlessness, unsightliness: thin-walled, lath-divided, narrow-garreted houses of clay; booths of a darksome Vanity Fair, busily base.

But on Whitby Hill, and by Bolton Brook,² remained traces of other handiwork. Men who could build had been there; and who also had wrought, not merely for their own days. But to what purpose? Strong faith, and steady hands, and patient souls—can this, then, be all you have left? this the sum of your doing on the earth;—a nest whence the night-owl may whimper to the brook, and a ribbed skeleton of consumed arches, looming above the bleak banks of mist, from its cliff to the sea?

As the strength of men to Giorgione, to Turner their weakness and vileness, were alone visible. They themselves, unworthy or ephemeral; their work, despicable, or decayed. In the Venetian's eyes, all beauty depended on man's presence and pride; in Turner's, on the solitude he had left, and the humiliation he had suffered.

§ 20. And thus the fate and issue of all his work were determined at once. He must be a painter of the strength

¹ [See Vol. III. p. 212; and below, p. 439.]

² [Of Bolton, again, there is an early sketch in the National Gallery, No. 525: see Vol. XIII. p. 254.]

of nature, there was no beauty elsewhere than in that; he must paint also the labour and sorrow and passing away of men: this was the great human truth visible to him.

Their labour, their sorrow, and their death. Mark the three. Labour; by sea and land, in field and city, at forge and furnace, helm and plough. No pastoral indolence nor classic pride shall stand between him and the troubling of the world; still less between him and the toil of his country, —blind, tormented, unwearied, marvellous England.

§ 21. Also their Sorrow; Ruin of all their glorious work, passing away of their thoughts and their honour, mirage of pleasure, FALLACY OF HOPE;¹ gathering of weed on temple step; gaining of wave on deserted strand; weeping of the mother for the children, desolate by her breathless first-born in the streets of the city,* desolate by her last sons slain, among the beasts of the field.†

§ 22. And their Death. That old Greek question again;² —yet unanswered. The unconquerable spectre still flitting among the forest trees at twilight; rising ribbed out of the sea-sand; —white, a strange Aphrodite,—out of the sea-foam; stretching its gray, cloven wings among the clouds; turning the light of their sunsets into blood. This has to be looked upon, and in a more terrible shape than ever Salvator or Dürer saw it. The wreck of one guilty country does not infer the ruin of all countries, and need not cause general terror respecting the laws of the universe. Neither did the orderly and narrow succession of domestic joy and sorrow in a small German community bring the question in its breadth, or in any unresolvable shape, before the mind of Dürer. But the English death—the European death of the nineteenth century—was of another range and power; more terrible a thousand-fold in its merely physical grasp

* "The Tenth Plague of Egypt."

† "Rizpah, the Daughter of Aiah."

¹ [The title of Turner's MS. poems, from which he quoted many lines for mottoes to his pictures: see Vol. XIII. p. 125 n.]

² [See above, part ix. ch. ii. § 19 seq. (pp. 275 seq).]

and grief; more terrible, incalculably, in its mystery and shame. What were the robber's casual pang, or the range of the flying skirmish, compared to the work of the axe, and the sword, and the famine, which was done during this man's youth on all the hills and plains of the Christian earth, from Moscow to Gibraltar? He was eighteen years old when Napoleon came down on Arcola. Look on the map of Europe and count the blood-stains on it, between Arcola and Waterloo.

§ 23. Not alone those blood-stains on the Alpine snow, and the blue of the Lombard plain. The English death was before his eyes also. No decent, calculable, consoled dying; no passing to rest like that of the aged burghers of Nuremberg town. No gentle processions to churchyards among the fields, the brouze crests bossed deep on the memorial tablets, and the skylark singing above them from among the corn. But the life trampled out in the slime of the street, crushed to dust amidst the roaring of the wheel, tossed countlessly away into howling winter wind along five hundred leagues of rock-fanged shore. Or, worst of all, rotted down to forgotten graves through years of ignorant patience, and vain seeking for help from man, for hope in God—infirm, imperfect yearning, as of motherless infants starving at the dawn; oppressed royalties of captive thought, vague ague-fits of bleak, amazed despair.

§ 24. A goodly landscape this, for the lad to paint, and under a goodly light. Wide enough the light was, and clear; no more Salvator's lurid chasm on jagged horizon,¹ nor Dürer's spotted rest of sunny gleam on hedgerow and field; but light over all the world. Full shone now its awful globe, one pallid charnel-house,—a ball strewn bright with human ashes, glaring in poised sway beneath the sun, all blinding-white with death from pole to pole,²—death, not of myriads of poor bodies only, but of will, and mercy, and conscience; death, not once inflicted on the flesh, but daily

¹ [See above, p. 308.]

² [The words "a ball . . . pole to pole" occur also in a piece of MS. which has been given in Vol. IV. p. 376.]

fastening on the spirit; death, not silent or patient, waiting his appointed hour, but voiceful, venomous; death with the taunting word, and burning grasp, and infixed sting.

“Put ye in the sickle, for the harvest is ripe.”¹ The word is spoken in our ears continually to other reapers than the angels,—to the busy skeletons that never tire for stooping. When the measure of iniquity is full, and it seems that another day might bring repentance and redemption,—“Put ye in the sickle.” When the young life has been wasted all away, and the eyes are just opening upon the tracks of ruin, and faint resolution rising in the heart for nobler things,—“Put ye in the sickle.” When the roughest blows of fortune have been borne long and bravely, and the hand is just stretched to grasp its goal,—“Put ye in the sickle.” And when there are but a few in the midst of a nation, to save it, or to teach, or to cherish; and all its life is bound up in those few golden ears,—“Put ye in the sickle, pale reapers, and pour hemlock for your feast of harvest home.”

This was the sight which opened on the young eyes, this the watchword sounding within the heart of Turner in his youth.

So taught, and prepared for his life's labour, sate the boy at last alone among his fair English hills; and began to paint, with cautious toil, the rocks, and fields, and trickling brooks, and soft white clouds of heaven.

¹ [Joel iii. 13. The following reference is to Revelation xiv. 14-20; and the use of “hemlock,” lower down, is suggested by Hosea x. 4.]

CHAPTER X

THE NEREID'S GUARD

§ 1. THE work of Turner, in its first period, is said in my account of his drawings at the National Gallery to be distinguished by "boldness of handling, generally gloomy tendency of mind, subdued colour, and perpetual reference to precedent in composition." I must refer the reader to those two catalogues* for a more special account of his early modes of technical study. Here we are concerned only with the expression of that gloomy tendency of mind, whose causes we are now better able to understand.

§ 2. It was prevented from overpowering him by his labour. This, continual, and as tranquil in its course as a ploughman's in the field, by demanding an admirable humility and patience, averted the tragic passion of youth. Full of stern sorrow and fixed purpose, the boy set himself to his labour silently and meekly, like a workman's child on its first day at the cotton-mill. Without haste, but without relaxation,—accepting all modes and means of progress, however painful or humiliating, he took the burden on his shoulder and began his march. There was nothing so little, but he noticed it; nothing so great, but he began preparations to cope with it. For some time his work is, apparently, feelingless, so patient and mechanical are the first essays. It gains gradually in power and grasp; there is no perceptible *aim* at freedom, or at fineness, but the

* "Notes on the Turner Collection at Marlborough House." 1857. "Catalogue of the Sketches of J. M. W. Turner exhibited at Marlborough House." 1858.¹

¹ [Vol. XIII. pp. 89-181, 227-316. The particular passage here cited is at p. 251.]

force insensibly becomes swifter, and the touch finer. The colour is always dark or subdued.

§ 3. Of the first forty subjects which he exhibited at the Royal Academy, thirty-one are architectural, and of these, twenty-one are of elaborate Gothic architecture (Peterborough Cathedral, Lincoln Cathedral, Malmesbury Abbey, Tintern Abbey, etc.). I look upon the discipline given to his hand by these formal drawings as of the highest importance. His mind was also gradually led by them into a calmer pensiveness.* Education amidst country possessing architectural remains of some noble kind, I believe to be wholly essential to the progress of a landscape artist. The first verses he ever attached to a picture were in 1798. They are from *Paradise Lost*, and refer to a picture of Morning, on the Coniston Fells:—

“Ye mists and exhalations, that now rise
From hill or steaming lake, dusky or gray,
Till the sun paints your fleecy skirts with gold,
In honour to the world’s great Author rise.”¹

By glancing over the verses, which in following years† he quotes from Milton, Thomson, and Mallet, it may be seen at once how his mind was set, so far as natural scenes were concerned, on rendering atmospheric effect;—and so

* The regret I expressed in the third volume² at Turner’s not having been educated under the influence of Gothic art was, therefore, mistaken; I had not then had access to his earliest studies. He *was* educated under the influence of Gothic architecture; but, in more advanced life, his mind was warped and weakened by classical architecture. Why he left the one for the other, or how far good influences were mingled with evil in the result of the change, I have not yet been able to determine.

† They may be referred to with ease in Boone’s Catalogue of Turner’s Pictures. 1857.³

¹ [See Vol. XIII. p. 406 and *n.*, and compare *ibid.*, pp. 126, 316.]

² [See Vol. V. p. 392, and compare Vol. XIII. pp. 153–159.]

³ [Or, now more accessibly, in the Appendix to Thornbury’s *Life*, where the Catalogue is repeated. In his first draft Ruskin referred more particularly to the picture of Dunstanborough (exhibited in 1798, now in the City Art Gallery, Melbourne), with the quotation from Thomson’s *Seasons*:—

“The desert joys,
Wildly thro’ all his melancholy bounds,
Rude ruins glitter.”]

far as emotion was to be expressed, how consistently it was melancholy.¹

He paints, first of heroic or meditative subjects, the Fifth Plague of Egypt; next, the Tenth Plague of Egypt. His first tribute to the Memory of Nelson is the "Battle of the Nile," 1799.² I presume an unimportant picture, as the power was not then availably developed. His first classical subject is Narcissus and Echo, in 1805:—

"So melts the youth, and languishes away,
His beauty withers, and his limbs decay."³

¹ [Thus in 1799 Turner exhibited "Harlech Castle," with the lines from Milton (*Paradise Lost*, book iv.):—

"Now came still evening on, and twilight grey
Had in her sober livery all things clad."

And in the same year, "Caernarvon Castle," with a quotation from Mallet (1705-1765):—

"Now rose
Sweet evening, solemn hour; the sun declined," etc.

Also "Warkworth Castle," with a quotation from Thomson's *Seasons*:—

"Behold, slow settling o'er the lurid grove,
Unusual darkness broods; and growing, gains
The full possession of the sky; and on yon baleful cloud
A redd'ning gloom, a magazine of fate,
Ferment."

² [The "Fifth Plague of Egypt" (with Exodus ix. 23 as its motto) was exhibited at the Academy in 1800, and is now in the collection of Sir Francis Cook. The "Tenth Plague" (with Exodus ix. 29, 30 as its motto) was exhibited at the Academy in 1802, and is No. 470 in the National Gallery. The "Battle of the Nile," exhibited at the Academy in 1799, was shown by the Nineteenth Century Art Society, July, 1886. "Narcissus and Echo" is at Petworth: "1805" is a slip of the pen for "1804" (the date of its exhibition at the Academy). The "Hesperides," exhibited at the British Institution in 1806, is No. 477 in the National Gallery. Turner's title was "The Goddess of Discord choosing the apple of contention in the Garden of the Hesperides"; and the following is the explanatory note in the official catalogue:—

"The three daughters of Hesperus, Aegle, Hesperie, and Erytheis, dwelt in this western garden, and had charge of the tree of the golden apples, the gift of Earth to Juno on her wedding day; the Hesperides and the garden were protected by the dragon Ladon. The Goddess of Discord, not having been invited to the marriage feast of Peleus and Thetis, threw one of these apples into the midst of the assembled gods, to be taken by the most beautiful. It was claimed by Juno, Minerva, and by Venus, and Jupiter ordered the contest to be decided by Paris, the son of Priam, who awarded the apple to Venus. This judgment of Paris was not only the cause of the destruction of Troy, but of countless misfortunes also to the Greeks. The Goddess of Discord is on the right in the act of receiving the golden apple (or orange) from one of the Hesperides. The dragon is seen lying along the summit of a lofty rock, in the middle distance."

³ [The first two lines of a longer passage cited by Turner in the catalogue; it is from a version of Ovid's *Metamorphoses*, iii. 489-501.]

The year following he summons his whole strength, and paints what we might suppose would be a happier subject, the Garden of the Hesperides. This being the most important picture of the first period, I will analyse it completely.¹

§ 4. The fable of the Hesperides had, it seems to me, in the Greek mind two distinct meanings; the first referring to natural phenomena, and the second to moral. The natural meaning of it I believe to have been this:—

The Garden of the Hesperides was supposed to exist in the westernmost part of the Cyrenaica; it was generally the expression for the beauty and luxuriant vegetation of the coast of Africa in that district. The centre of the Cyrenaica “is occupied by a moderately elevated table-land, whose edge runs parallel to the coast, to which it sinks down in a succession of terraces, clothed with verdure, intersected by mountain-streams running through ravines filled with the richest vegetation; well watered by frequent rains, exposed to the cool sea-breeze from the north, and sheltered by the mass of the mountain from the sands and hot winds of the Sahara.” *

The Greek colony of Cyrene itself was founded ten miles from the sea-shore, “in a spot backed by the mountains on the south, and thus sheltered from the fiery blasts of the desert; while at the height of about 1,800 feet an inexhaustible spring bursts forth amidst luxuriant vegetation, and pours its waters down to the Mediterranean through a most beautiful ravine.”

The nymphs of the west, or Hesperides, are, therefore, I believe, as natural types, the representatives of the soft western winds and sunshine, which were in this district most favourable to vegetation. In this sense they are called daughters of Atlas and Hesperis, the western winds being

* Smith's *Dictionary of Greek and Roman Geography*. Art. “Cyrenaica.”

¹ [For other discussions of the picture, see *Notes on the Turner Collection*, Vol. XIII. pp. 113–119, and *Lectures on Landscape*, §§ 69–71.]

cooled by the snow of Atlas.¹ The dragon, on the contrary, is the representative of the Sahara wind, or Simoom, which blew over the garden from above the hills on the south, and forbade all advance of cultivation beyond their ridge. Whether this was the physical meaning of the tradition in the Greek mind or not, there can be no doubt of its being Turner's first interpretation of it. A glance at the picture may determine this: a clear fountain being made the principal object in the foreground,—a bright and strong torrent in the distance,—while the dragon, wrapped in flame and whirlwind, watches from the top of the cliff.

§ 5. But, both in the Greek mind and in Turner's, this natural meaning of the legend was a completely subordinate one. The moral significance of it lay far deeper. In the second, but principal sense, the Hesperides were not daughters of Atlas, nor connected with the winds of the west, but with its splendour. They are properly the nymphs of the sunset, and are the daughters of night, having many brothers and sisters, of whom I shall take Hesiod's account.²

§ 6. "And the Night begat Doom, and short-withering Fate, and Death.

"And begat Sleep, and the company of Dreams, and Censure, and Sorrow.

"And the Hesperides, who keep the golden fruit beyond the mighty Sea.

"And the Destinies, and the Spirits of merciless punishment.

"And Jealousy, and Deceit, and Wanton Love; and Old Age, that fades away; and Strife, whose will endures."

§ 7. We have not, I think, hitherto quite understood the Greek feeling about those nymphs and their golden apples, coming as a light in the midst of a cloud;—between Censure, and Sorrow,—and the Destinies. We must look

¹ [See Diodorus Siculus, iv. 27.]

² [*Theogony*, 211 *seq.*]

to the precise meaning of Hesiod's words, in order to get the force of the passage.

"The night begat Doom"; that is to say, the doom of unforeseen accident—doom essentially of darkness.

"And short-withering Fate." Ill translated. I cannot do it better.¹ It means especially the sudden fate which brings untimely end to all purpose, and cuts off youth and its promise: called, therefore (the epithet hardly ever leaving it), "black Fate."

"And Death." This is the universal, inevitable death, opposed to the interfering, untimely death. These three are named as the elder children. Hesiod pauses, and repeats the word "begat" before going on to number the others.

"And begat Sleep, and the Company of Dreams."

"And *Censure*." "Momus," the Spirit of Blame—the spirit which desires to blame rather than to praise;—false, base, unhelpful, unholy judgment;—ignorant and blind, child of the Night.

"And Sorrow." Accurately, sorrow of mourning; the sorrow of the night when no man can work: of the night that falls when what was the light of the eyes is taken from us; lamenting, sightless sorrow, without hope,—child of Night.

"And the Hesperides." We will come back to these.

"And the Destinies, and the Spirits of Merciless Punishment." These are the great Fates which have rule over conduct; the first fate spoken of (short-withering) is that which has rule over occurrence. These great Fates are Clotho, Lachesis, Atropos. Their three powers are,—Clotho's over the clue, the thread, or connecting energy,—that is, the conduct of life; Lachesis' over the lot—that is to say, the chance which warps, entangles, or bends the course of life. Atropos, inflexible, cuts the thread for ever.²

¹ [Hesiod's words are :—

Νύξ δ' ἔτεκε στυγερὸν τε Μόρον καὶ Κῆρα μέλαιναν
καὶ Θάνατον, τέκε δ' Ὕπνον, ἔτικτε δὲ φθλὸν Ὀνείρων.]

² [A Fate whose power Ruskin was often to feel and recognise: see *For's Clavigera*, Letters 59, 60, etc. For a translation of a passage from Lucian in which Clotho is introduced, see "The Tortoise of Ægina," § 10.]

"And Jealousy," especially the jealousy of Fortune, in balancing all good by evil. The Greeks had a peculiar dread of this form of fate.

"And Deceit, and sensual Love. And Old Age that fades, and Strife that endures"; that is to say, old age, which, growing not in wisdom, is marked only by its failing power—by the gradual gaining of darkness on the faculties, and helplessness on the frame. Such age is the forerunner of true death—the child of Night. "And Strife," the last and the mightiest, the nearest to man of the Night-children—blind leader of the blind.¹

§ 8. Understanding thus whose sisters they are, let us consider of the Hesperides themselves—spoken of commonly as the "Singing Nymphs."² They are four.³

Their names are, *Ægle*,—Brightness; *Erytheia*,—Blushing; *Hestia*,—the (spirit of the) Hearth; *Arethusa*,—the Ministering.

O English reader! hast thou ever heard of these fair and true daughters of Sunset, beyond the mighty sea?

And was it not well to trust to such keepers the guarding of the golden fruit which the earth gave to Juno at her marriage? Not fruit only: fruit on the tree, given by the earth, the great mother, to Juno (female power), at her marriage with Jupiter, or *ruling* manly power (distinguished from the tried and *agonizing* strength of Hercules). I call Juno, briefly, female power. She is, especially, the goddess presiding over marriage, regarding the woman as the mistress of a household. Vesta (the goddess of the hearth*), with

* Her name is also that of the Hesperid nymph; but I give the Hesperid her Greek form of name, to distinguish her from the goddess. The Hesperid *Arethusa* has the same subordinate relation to Ceres; and *Erytheia*, to Venus. *Æglé* signifies especially the spirit of brightness or cheerfulness; including even the subordinate idea of household neatness or cleanliness.

¹ [Matthew xv. 14.]

² [So in Euripides, *Hercules Furens*, 394: ὑμῶδούς τε κόρας ἤλυθεν ἔσπεριαν ἐς αὐλάν (see below, § 12).]

³ [Their names are given by Apollodorus, ii. 5, 11. The ordinary mythology, however, speaks of only three—*Æglé*, *Erytheia*, and *Hesperethusa*; so in Milton (*Comus*, 981):—

"All amidst the gardens fair
Of Hesperus, and his daughters three."]

Ceres, and Venus, are variously dominant over marriage, as the fulfilment of love; but Juno is pre-eminently the housewives' goddess. She therefore represents, in her character, whatever good or evil may result from female ambition, or desire of power: and, as to a housewife, the earth presents its golden fruit to her, which she gives to two kinds of guardians. The wealth of the earth, as the source of household peace and plenty, is watched by the singing nymphs—the Hesperides. But, as the source of household sorrow and desolation, it is watched by the Dragon.

We must, therefore, see who the Dragon was, and what kind of dragon.

§ 9. The reader will, perhaps, remember that we traced in an earlier chapter,¹ the birth of the Gorgons, through Phorcys and Ceto, from Nereus. The youngest child of Phorcys and Ceto is the Dragon of the Hesperides;² but this latest descent is not, as in Northern traditions,³ a sign of fortunateness: on the contrary, the children of Nereus receive gradually more and more terror and power, as they are later born, till this last of the Nereids unites horror and power at their utmost. Observe the gradual change. Nereus himself is said to have been perfectly *true*, and *gentle*.

This is Hesiod's account of him:—

“And Pontus begat Nereus, simple and true, the oldest of children; but they call him the aged man, in that he is errorless and kind; neither forgets he what is right; but knows all just and gentle counsel.”⁴

§ 10. Now the children of Nereus, like the Hesperides themselves, bear a twofold typical character; one physical, the other moral. In his physical symbolism, Nereus himself is the calm and gentle sea, from which rise, in gradual

¹ [See above, p. 182.]

² [Hesiod, *Theogony*, 334, 335: “And Ceto mingling in love with Phorcys brought forth, as youngest born, a terrible serpent which in the secret places of dark earth guards the all-golden apples,” etc. (see Ruskin's translation in § 12).]

³ [See, for example, Grimm's *Fairy Tales*, often based on Scandinavian and North German legends, in which the youngest son succeeds, where his elder brothers have failed.]

⁴ [*Theogony*, 233–236.]

increase of terror, the clouds and storms. In his moral character, Nereus is the type of the deep, pure, rightly-tempered human mind, from which, in gradual degeneracy, spring the troubling passions.

Keeping this double meaning in view, observe the whole line of descent to the Hesperides' Dragon. Nereus, by the Earth, begets (1) Thaumas (the wonderful), physically, the father of the Rainbow; morally, the type of the enchantments and dangers of imagination. His grandchildren, besides the Rainbow, are the Harpies. (2) Phorcys (Orcus?), physically, the treachery or devouring spirit of the sea; morally, covetousness or malignity of heart. (3) Ceto, physically, the deep places of the sea; morally, secretness of heart, called "fair-cheeked," because tranquil in outward aspect. (4) Eurybia (wide strength), physically, the flowing, especially the tidal power of the sea (she, by one of the sons of Heaven, becomes the mother of three great Titans,¹ one of whom, Astræus, and the Dawn, are the parents of the four Winds); morally, the healthy passion of the heart. Thus far the children of Nereus.

§ 11. Next, Phorcys and Ceto, in their physical characters (the grasping or devouring of the sea, reaching out over the land, and its depth), beget the Clouds and Storms—namely, first, the Graiæ, or soft rain-clouds; then the Gorgons, or storm-clouds; and youngest and last, the Hesperides' Dragon,—Volcanic or earth-storm, associated, in conception, with the Simoom and fiery African winds.

But, in its moral significance, the descent is this. Covetousness, or malignity (Phorcys), and Secretness (Ceto), beget, first, the darkening passions, whose hair is always gray; then the stormy and merciless passions, brazen-winged (the Gorgons), of whom the dominant, Medusa, is ice-cold, turning all who look on her to stone. And, lastly, the consuming (poisonous and volcanic) passions—the "flame-backed dragon,"² uniting the powers of poison, and instant

¹ [Hesiod, *Theogony*, 375, 378.]

² [δράκοντα πυρόεντων: Euripides, *Hercules Furens*, 398.]

destruction. Now the reader may have heard, perhaps, in other books of Genesis than Hesiod's, of a dragon being busy about a tree which bore apples, and of crushing the head of that dragon; but seeing how, in the Greek mind, this serpent was descended from the sea, he may, perhaps, be surprised to remember another verse, bearing also on the matter:—"Thou brakest the heads of the dragons in the waters";¹ and yet more surprised, going on with the Septuagint version, to find where he is being led: "Thou brakest the head of the dragon, and gavest him to be meat to the Ethiopian people. Thou didst tear asunder the strong fountains and the storm-torrents; thou didst dry up the rivers of Etham," *πηγὰς καὶ χειμάρρους*, the Pegasus fountains—"Etham on the edge of the wilderness."

§ 12. Returning then to Hesiod, we find he tells us of the Dragon himself:—"He, in the secret places of the desert land, kept the all-golden apples in his great knots" (coils of rope, or extremities of anything).² With which compare Euripides' report of him:—"And Hercules came to the Hesperian dome, to the singing maidens, plucking the apple-fruit from the golden petals; slaying the flame-backed dragon, who, twined round and round, kept guard in unapproachable spires"³ (spirals or whirls, as of a whirlwind-vortex).

Farther, we hear from other scattered syllables of tradition, that this dragon was sleepless, and that he was able to take various tones of human voice.⁴

And we find a later tradition than Hesiod's calling him

¹ [Psalm lxxiv. 13, 14, 15. In the second of these verses the Septuagint has, however, τὰς κεφαλὰς τοῦ δράκοντος—"the heads of the dragon"; for "Etham in the wilderness," see Exodus xiii. 20.]

² [*Theogony*, 334, 335:—

ὅς ἐρεμνῆς κεύθει γαίης
πείρασιν ἐν μεγάλοις παγχρύσεια μῆλα φυλάσσει.

If it were possible thus to interpret πείρασιν ἐν μεγάλοις—making πείρασιν mean coils, and not ends—Ruskin's version would be an improvement on the ordinary translation, which is "in the vast boundaries of the earth," i.e., in the illimitable realms "beyond the mighty sea."]

³ [*Hercules Furens*, 394-400.]

⁴ [Apollodorus, ii. 5, 11: ἐφύλασσε δὲ αὐτὰ (μῆλα) δράκων ἀθάνατος, Τυφῶνος καὶ Εὐχιδῆος, κεφαλὰς ἔχων ἑκατόν· ἐχρήτο δὲ φωναῖς παντοίαις καὶ ποικίλαις.]

a child of Typhon and Echidna. Now Typhon is volcanic storm, generally the evil spirit of tumult.

Echidna (the adder) is a descendant of Medusa.¹ She is a daughter of Chrysaor (the lightning), by Callirhoë (the fair flowing), a daughter of Ocean;—that is to say, she joins the intense fatality of the lightning with perfect gentleness. In form she is half-maiden, half-serpent; therefore she is the spirit of all the fatallest evil, veiled in gentleness: or, in one word, treachery;—having dominion over many gentle things;—and chiefly over a kiss, given, indeed, in another garden than that of the Hesperides, yet in relation to keeping of treasure also.²

§ 13. Having got this farther clue, let us look who it is whom Dante makes the typical Spirit of Treachery. The eighth or lowest pit of hell is given to its keeping; at the edge of which pit, Virgil casts a *rope* down for a signal; instantly there rises, as from the sea, “as one returns who hath been down to loose some anchor,” “the fell monster with the deadly sting, who passes mountains, breaks through fenced walls, and firm embattled spears; and with his filth taints all the world.”³

Think for an instant of another place:—“Sharp stones are under him, he laugheth at the shaking of a spear.”⁴ We must yet keep to Dante, however. Echidna, remember, is half-maiden, half-serpent;—hear what Dante's Fraud is like:—

“Forthwith that image vile of Fraud appear'd,
His head and upper part exposed on land,
But laid not on the shore his bestial train.
His face the semblance of a just man's wore,
So kind and gracious was its outward cheer;
The rest was serpent all: two shaggy claws

¹ [Here we revert to Hesiod, who makes Chrysaor spring from Medusa, and Chrysaor, by union with Callirhoë, bear Echidna (*Theogony*, 281, 287, 295).]

² [The MS. has: “. . . and chiefly over a kiss in another garden than that of the Hesperides, yet in relation with keeping of gold, or at least of silver” (Matthew xxvi. 49; xxvii. 3).]

³ [*Inferno*, xvi. 133; xvii. 1-3 (Cary's translation, which also is followed in the next passage, *ibid.*, 7-27).]

⁴ [Job xli. 29.]

Reach'd to the armpits; and the back and breast,
 And either side, were painted o'er with nodes
 And orbits. Colours variegated more
 Nor Turks nor Tartars 'e'er on cloth of state
 With interchangeable embroidery wove,
 Nor spread Arachne o'er her curious loom.
 As oft-times a light skiff moor'd to the shore,
 Stands part in water, part upon the land;
 Or, as where dwells the greedy German boor,
 The beaver settles, watching for his prey;
 So on the rim, that fenced the sand with rock,
 Sat perch'd the fiend of evil. In the void
 Glancing, his tail upturn'd, its venomous fork
 With sting like scorpion's arm'd."

§ 14. You observe throughout this description the leaning on the character of the *Sea Dragon*; a little farther on, his way of flying is told us:—

"As a small vessel, backening out from land,
 Her station quits; so thence the monster loos'd,
 And, when he felt himself at large, turn'd round
 There, where the breast had been, his forked tail.
 Thus, like an eel, outstretch'd, at length he steer'd,
 Gathering the air up with retractile claws."¹

And, lastly, his name is told us: Geryon.² Whereupon, looking back to Hesiod, we find that Geryon is Echidna's brother.³ Man-serpent, therefore, in Dante, as Echidna is woman-serpent.

We find next that Geryon lived in the island of Erytheia (blushing), only another kind of blushing than that of the Hesperid Erytheia. But it is on, also, a western island, and Geryon kept red oxen in it (said to be near the red setting sun); and Hercules kills him, as he does the Hesperian dragon: but in order to be able to reach him, a golden boat is given to Hercules by the Sun, to cross the sea in.

§ 15. We will return to this part of the legend presently, having enough of it now collected to get at the complete idea of the Hesperian dragon, who is, in fine, the "Pluto

¹ [*Inferno*, xvii. 100–105 (again Cary's translation).]

² [*Ibid.*, 133.]

³ [*Theogony*, 287 seq.]

il gran nemico" of Dante;¹ the demon of all evil passions connected with covetousness; that is to say, essentially of fraud, rage, and gloom. Regarded as the demon of Fraud, he is said to be descended from the viper Echidna, full of deadly cunning, in whirl on whirl; as the demon of consuming Rage from Phoreys; as the demon of Gloom, from Ceto;—in his watching and melancholy, he is sleepless (compare the Micyllus dialogue of Lucian²); breathing whirlwind and fire, he is the destroyer, descended from Typhon as well as Phoreys; having, moreover, with all these, the irresistible strength of his ancestral sea.

§ 16. Now, look at him, as Turner has drawn him (p. 402).³ I cannot reduce the creature to this scale without losing half his power; his length, especially, seems to diminish more than it should in proportion to his bulk. In the picture he is far in the distance, cresting the mountain; and may be, perhaps, three-quarters of a mile long. The actual length on the canvas is a foot and eight inches; so that it may be judged how much he loses by the reduction, not to speak of my imperfect etching,* and of the loss which, however well he might have been engraved, he would still have sustained, in the impossibility of expressing the lurid colour of his armour, alternate bronze and blue.

§ 17. Still, the main points of him are discernible enough: and among all the wonderful things that Turner did in his day, I think this nearly the most wonderful. How far he had really found out for himself the collateral bearings of

* It is merely a sketch on the steel, like the illustrations before given of composition; but it marks the points needing note. Perhaps some day I may be able to engrave it of the full size.⁴

¹ [*Inferno*, vi., last line: "Quivi trovammo Pluto il gran nemico." Quoted again by Ruskin in *Munera Pulveris*, § 90, and *Lectures on Landscape*, § 90.]

² [Where the eternal disquietude of Wealth and High Estate are contrasted with the easy sleep of poverty. For another reference to the dialogue, see above, p. 285.]

³ [The title of the Plate—"Quivi trovammo"—is from Dante (see above): "There we found"—the dragon here represented. The Plate from the original editions was also published in *Lectures on Landscape*, opposite p. 69; in this edition the Plate has had to be reduced by about one-fourth.]

⁴ [For this scheme, see above, p. 8 n.]

the Hesperid tradition I know not; but that he had got the main clue of it, and knew who the Dragon was, there can be no doubt; the strange thing is, that his conception of it throughout, down to the minutest detail, fits every one of the circumstances of the Greek traditions. There is, first, the Dragon's descent from Medusa and Typhon, indicated in the serpent-clouds floating from his head (compare my sketch of the Medusa-cloud, Plate 71); then note the grovelling and ponderous body, ending in a serpent, of which we do not see the end. He drags the weight of it forward by his claws, not being able to lift himself from the ground ("Mammon, the least erected spirit that fell"¹); then the grip of the claws themselves as if they would clutch (rather than tear) the rock itself into pieces; but chiefly, the designing of the body. Remember, one of the essential characters of the creature, as descended from Medusa, is its coldness and petrifying power; this, in the demon of covetousness, must exist to the utmost; breathing fire, he is yet himself of ice. Now, if I were merely to draw this dragon as white, instead of dark, and take his claws away, his body would become a representation of a great glacier, so nearly perfect, that I know no published engraving of glacier breaking over a rocky brow so like the truth as this dragon's shoulders² would be, if they were thrown out in light; there being only this difference, that they have the form, but not the fragility of the ice; they are at once ice and iron. "His bones are like solid pieces of brass; his bones are like bars of iron; by his neesings a light doth shine."³

¹ [*Paradise Lost*, i. 679: quoted again in Vol. XVI. p. 439.]

² [In the first draft the passage reads:—

" . . . so nearly perfect, that I know no published engraving of the upper part of the Glacier des Bois, when it first breaks over the rock towards the Source of the Arveron, so like it as this dragon's shoulders . . . "

The resemblance of the glacier to a serpent was seized also by Shelley in his lines on "Mont Blanc," written in the Vale of Chamouni:—

"The glaciers creep
Like snakes that watch their prey, from their far fountains,
Slow rolling on."

³ [Job xli. 18.]

§ 18. The strange unity of vertebrated action, and of a true bony contour, infinitely varied in every vertebra, with this glacial outline;—together with the adoption of the head of the Ganges crocodile, the fish-eater, to show his sea descent (and this in the year 1806, when hardly a single fossil saurian skeleton existed within Turner's reach).¹ renders the whole conception one of the most curious exertions of the imaginative intellect with which I am acquainted in the arts.

§ 19. Thus far then, of the dragon; next, we have to examine the conception of the Goddess of Discord. We must return, for a moment, to the tradition about Geryon. I cannot yet decipher the meaning of his oxen, said to be fed together with those of Hades; nor of the journey of Hercules, in which, after slaying Geryon, he returns through Europe like a border forager, driving these herds, and led into farther battle in protection or recovery of them.² But it seems to me the main drift of the legend cannot be mistaken; viz., that Geryon is the evil spirit of wealth, as arising from commerce; hence, placed as a guardian of isles in the most distant sea, and reached in a golden boat; while the Hesperian dragon is the evil spirit of wealth, as possessed in households; and associated, therefore, with the true household guardians, or singing nymphs. Hercules (manly labour), slaying both Geryon and Ladon, presents oxen and apples to Juno who is their proper mistress; but the Goddess of Discord, contriving that one portion of this household wealth shall be ill bestowed by Paris, he, according to Coleridge's interpretation,³ choosing pleasure instead of wisdom or power;—there issue from this evil choice the catastrophe of the Trojan war, and the wanderings of Ulysses, which are essentially, both in the *Iliad* and

¹ [Compare the account of the picture in Vol. XIII. p. 118.]

² [See Apollodorus, ii. 106 *seq.*, for these legends.]

³ [The editors do not find this reference in Coleridge, though he discusses the choice of Hercules (in *The Friend*, introduction to the Second Section). Probably Ruskin, recollecting that, wrote "Coleridge" by a slip for "Bacon"; the interpretation is given in *The Advancement of Learning* (i. 8, 7).]

Odyssey, the troubling of household peace;¹ terminating with the restoration of this peace by repentance and patience; Helen and Penelope seen at last sitting upon their household thrones, in the Hesperian light of age.

§ 20. We have, therefore, to regard Discord, in the Hesperides garden, eminently as the disturber of households, assuming a different aspect from Homer's wild and fierce discord of war. They are, nevertheless, one and the same power; for she changes her aspect at will. I cannot get at the root of her name, Eris.² It seems to me as if it ought to have one in common with Erinnyes (Fury); but it means always contention, emulation, or competition, either in mind or in words;—the final work of Eris is essentially "division," and she is herself always double-minded; shouts two ways at once (in *Iliad*, xi. 6), and wears a mantle rent in half (*Æneid*, viii. 702). Homer makes her loud-voiced,³ and insatiably covetous. This last attribute is, with him, the source of her usual title. She is little when she first is seen, then rises till her head touches heaven.⁴ By Virgil she is called mad; and her hair is of serpents, bound with bloody garlands.⁵

§ 21. This is the conception first adopted by Turner, but combined with another which he found in Spenser; only note that there is some confusion in the minds of English poets between Eris (Discord) and Até (Error), who is a daughter of Discord, according to Hesiod.⁶ She is properly—mischievous error, tender-footed;⁷ for she does not walk on the earth, but on heads of men (*Iliad*, xix. 92); *i.e.*, not on the solid ground, but on human vain thoughts; therefore, her hair is glittering⁸ (*Iliad*, xix. 126).

¹ [Compare what Ruskin says above, p. 273.]

² [According to some, akin to *irasci*: the angry one.]

³ [See *Iliad*, xi. 10 : *ἐνθα σῆσ' ἦσε θεὰ μέγα τε δεινὸν τε ὄρθη*. She is "insatiably covetous" (*ἀμορον μεμανία*) in *Iliad*, iv. 440, and so again in v. 518. Her usual title is *θυμοβόρος*, eating the heart.]

⁴ [See *Iliad*, iv. 442, 443.]

⁵ [*Æneid*, vi. 280 : "Discordia demens Vipereum crinem vittis innexa cruentis."]

⁶ [*Theogony*, 230.]

⁷ [*τῇ μὲν θ' ἀπαλοὶ πόδες* : *Iliad*, xix. 92.]

⁸ [*κεφαλῆς λιπαροπλοκάμιοι*.]

I think she is mainly the confusion of mind coming of pride, as Eris comes of covetousness; therefore, Homer makes her a daughter of Jove.¹ Spenser, under the name of Até, describes Eris. I referred to his account of her in my notice of the Discord on the Ducal Palace of Venice (remember the inscription there, *Discordia sum, discordans*). (*Stones of Venice*, II. viii. 71.²) But the stanzas from which Turner derived his conception of her are these—

“Als, as she double spake, so heard she double,
 Witn matchless eares deformed and distort,
 Fild with false rumors and seditious trouble,
 Bred in assemblies of the vulgar sort,
 That still are led with every light report:
 And as her cares, so eke her feet were odde,
 And much unlike: th’ one long, th’ other short,
 And botn misplast; that, when th’ one forward yode,
 The other backe retired and contrarie trode.

“Likewise unequall were her handes twaine;
 That one did reach, the other pusht away;
 That one did make, the other mard againe,
 And sought to bring all things unto decay;
 Whereby great riches, gathered manie a day,
 She in short space did often bring to nought,
 And their possessours often did dismay:
 For all her studie was, and all her thought,
 How she might overthrow the things that Concord wrought.

“So much her malice did her might surpas,
 That even th’ Almighty selfe she did maligne,
 Because to man so merciful He was,
 And unto all His creatures so benigne,
 Sith she herself was of His grace indigne:
 For all this worlds faire workmanship she tride
 Unto his last confusion to bring,
 And that great golden chaine quite to divide,
 With which it blessed Concord hath together tide.”

All these circumstances of decrepitude and distortion Turner has followed, through hand and limb, with patient care: he has added one final touch of his own. The nymph

¹ [*Iliad*, xix. 91.]

² [In this edition, Vol. X. p. 390. The following stanzas are from the *Faerie Queene*, book iv. canto i. 27-29.]

who brings the apples to the goddess, offers her one in each hand ; and Eris, of the divided mind, cannot choose.

§ 22. One farther circumstance must be noted, in order to complete our understanding of the picture,¹—the gloom extending, not to the dragon only, but also to the fountain and the tree of golden fruit. The reason of this gloom may be found in two other passages of the authors from which Turner had taken his conception of Eris—Virgil and Spenser. For though the Hesperides in their own character, as the nymphs of domestic joy, are entirely bright (and the garden always bright around them), yet seen or remembered in sorrow, or in the presence of discord, they deepen distress. Their entirely happy character is given by Euripides:—"The fruit-planted shore of the Hesperides,—songstresses,—where the ruler of the purple lake allows not any more to the sailor his way, assigning the boundary of Heaven which Atlas holds ; where the ambrosial fountains flow, and the fruitful and divine land increases the happiness of the gods."²

But to the thoughts of Dido, in her despair, they recur under another aspect ; she remembers their priestess as a great enchantress ; who *feeds the dragon* and preserves the boughs of the trees ; sprinkling moist honey and drowsy poppy ; who also has power over ghosts ; "and the earth shakes and the forests stoop from the hills at her bidding."³

§ 23. This passage Turner must have known well, from his continual interest in Carthage : but his diminution of the splendour of the old Greek garden was certainly caused

¹ [The MS. reads :—

" . . . our understanding of the picture,—its sadness of colour. It has been much spoiled by cleaning ; nevertheless, when I knew it in Turner's Gallery, it was distinctly more solemn in colour than his other works. At first I thought he meant the gardens to be darkened merely by the presence of Eris, but I found afterwards the reason of this gloom in two other passages . . . "

For Ruskin's earlier description of the picture, referred to in this passage, see *Notes on the Turner Gallery*, Vol. XIII. pp. 113-119.]

² [*Hippolytus*, 741 seq.]

³ [*Æneid*, iv. 484-486.]

chiefly by Spenser's describing the Hesperides fruit as growing first in the garden of Mammon :—

“There mournfull cypresse grew in greatest store
And trees of bitter gail; and heben sad;
Dead sleeping poppy; and black hellebore;
Cold coloquintida; and tetra mad;
Mortal samnitis; and cicuta bad,
With which th' unjust Atheniens made to dy
Wise Socrates, who, thereof quaffing glad,
Poured out his life and last philosophy.

* * * * *

“The gardin of Proserpina this hight:
And in the midst thereof a silver seat,
With a thick arbor goodly over-dight,
In which she often usd from open heat
Herselfe to shroud, and pleasures to entreat:
Next thereunto did grow a goodly tree,
With braunches broad dispredd and body great,
Clothe' with leaves, that none the wood mote see,
And loaden all with fruit as thick as it might bee.

“Their fruit were golden apples glistring bright,
That goodly was their glory to behold;
On earth like never grew, ne living wight
Like ever saw, but they from hence were sold;
For those, which Hercules with conquest bold
Got from great Atlas daughters, hence began.

* * * * *

“Here eke that famous golden apple grew,
The which amongst the gods false Até threw.”¹

There are two collateral evidences in the pictures of Turner's mind having been partly influenced by this passage. The excessive darkness of the stream,—though one of the Cyrene fountains—to remind us of Cocytus; and the breaking of the bough of the tree by the weight of its apples—not healthily, but as a diseased tree would break.

§ 24. Such then is our English painter's first great religious picture; and exponent of our English faith. A sad-coloured work, not executed in Angelico's white and gold; nor in Perugino's crimson and azure; but in a sulphurous

¹ [*Fuerie Queene*, book ii. canto vii. 52, 53, 54, 55.]

hue, as relating to a paradise of smoke. That power, it appears, on the hill-top, is our British Madonna: whom, reverently, the English devotional painter must paint, thus enthroned, with nimbus about the gracious head. Our Madonna,—or our Jupiter on Olympus,—or, perhaps, more accurately still, our unknown god, sea-born, with the cliffs, not of Cyrene, but of England, for his altar; and no chance of any Mars' Hill proclamation concerning him, "whom therefore ye ignorantly worship."¹

§ 25. This is no irony. The fact is verily so. The greatest man of our England, in the first half of the nineteenth century, in the strength and hope of his youth, perceives this to be the thing he has to tell us of utmost moment, connected with the spiritual world. In each city and country of past time, the master-minds had to declare the chief worship which lay at the nation's heart; to define it; adorn it; show the range and authority of it. Thus in Athens, we have the triumph of Pallas; and in Venice the Assumption of the Virgin; here, in England, is our great spiritual fact for ever interpreted to us—the Assumption of the Dragon. No St. George any more to be heard of; no more dragon-slaying possible: this child, born on St. George's Day, can only make manifest the dragon, not slay him, sea-serpent as he is; whom the English Andromeda, not fearing, takes for her lord. The fairy English Queen once thought to command the waves, but it is the sea-dragon now who commands her valleys; of old the Angel of the Sea ministered to them, but now the Serpent of the Sea; where once flowed their clear springs now spreads the black Cocytus pool; and the fair blooming of the Hesperid meadows fades into ashes beneath the Nereid's Guard.

Yes, Albert of Nuremberg; the time has at last come. Another nation has arisen in the strength of its Black anger; and another hand has pourtrayed the spirit of its toil. Crowned with fire, and with the wings of the bat.²

Allcock del.

79. The Hesperid Eagle

CHAPTER XI

THE HESPERID ÆGLÉ

§ 1. FIVE years after the Hesperides were painted, another great mythological subject appeared by Turner's hand. Another dragon—this time not triumphant, but in death-pang, the Python slain by Apollo.¹

Not in a garden, this slaying, but in a hollow, among wildest rocks, beside a stagnant pool. Yet, instead of the sombre colouring of the Hesperid hills, strange gleams of blue and gold flit around the mountain peaks, and colour the clouds above them.

The picture is at once the type, and the first expression of a great change which was passing in Turner's mind. A change, which was not clearly manifested in all its results until much later in his life; but in the colouring of this picture are the first signs of it; and in the subject of this picture, its symbol.

§ 2. Had Turner died early, the reputation he would

¹ ["Apollo and the Python" (No. 488 in the National Gallery) was exhibited in 1811, with the following lines in the catalogue:—

"Envenom'd by thy darts, the monster coil'd,
Portentous, horrible, and vast, his snake-like form :
Rent the huge portal of the rocky den,
And in the throes of death, he tore
His many wounds in one, while earth
Absorbing, blacken'd with his gore.

—Hymn of Callimachus."

So Turner wrote in the catalogue, but there is little doubt that the lines were of his own composition. They are not from Callimachus, but are a combination of the descriptions of two of Ovid's dragons—the Python (*Metamorphoses*, book i.) and the dragon destroyed by Cadmus (book iii.). Something very like a javelin, Cadmus's weapon, is sticking in the dragon, and has reappeared after being painted out, so that it is possible that Turner meant the hero of the picture, in the first instance, to be Cadmus and not Apollo (see Cosmo Monkhouse's *Turner*, pp. 68, 77). For Ruskin's earlier account of the picture, see Vol. Xii. p. 122.]

have left, though great and enduring, would have been strangely different from that which ultimately must now attach to his name. He would have been remembered as one of the severest of painters; his iron touch and positive forms would have been continually opposed to the delicacy of Claude and richness of Titian; he would have been spoken of, popularly, as a man who had no eye for colour. Perhaps here and there a watchful critic might have shown this popular idea to be false; but no conception could have been formed by any one of the man's real disposition or capacity.

It was only after the year 1820 that these were determinable, and his peculiar work discerned.

§ 3. He had begun by faithful declaration of the sorrow there was in the world. It is now permitted him to see also its beauty. He becomes, separately and without rival, the painter of the loveliness and light of the creation.

Of its loveliness: that which may be beloved in it, the tenderest, kindest, most feminine of its aspects. Of its light: light not merely diffused, but interpreted; light seen pre-eminently in colour.

Claude and Cuyp had painted the *sunshine*, Turner alone, the *sun colour*.¹

Observe this accurately. Those easily understood effects of afternoon light, gracious and sweet so far as they reach, are produced by the softly warm or yellow rays of the sun falling through mist. They are low in tone, even in nature, and disguise the colours of objects. They are imitable even by persons who have little or no gift of colour, if the tones of the picture are kept low and in true harmony, and the reflected lights warm. But they never could be painted by great colourists. The fact of blue and crimson being effaced by yellow and gray, puts such effect at once out of the notice or thought of a colourist, unless he has some special interest in the motive of it. You might as well ask a musician to compose with only three notes, as Titian to

¹ [For Cuyp's sunshine, see above, p. 333; for Claude's, p. 320.]

paint without crimson and blue. Accordingly the colourists in general, feeling that no other than this yellow sunshine was imitable, refused it, and painted in twilight, when the colour was full. Therefore, from the imperfect colourists,—from Cuyp, Claude, Both, Wilson, we get deceptive effect of sunshine; never from the Venetians, from Rubens, Reynolds, or Velasquez. From these we get only conventional substitutions for it, Rubens being especially daring* in frankness of symbol.

§ 4. Turner, however, as a landscape painter, had to represent sunshine of one kind or another. He went steadily through the subdued golden chord, and painted Cuyp's favourite effect, "sun rising through vapour,"¹ for many a weary year. But this was not enough for him. He must paint the sun in his strength, the sun rising *not* through vapour. If you glance at that Apollo slaying the Python, you will see there is rose colour and blue on the clouds, as well as gold; and if then you turn to the Apollo in the Ulysses and Polyphemus—his horses are rising beyond the horizon,²—you see he is not "rising through vapour," but above it;—gaining somewhat of a victory over vapour, it appears.

The old Dutch brewer, with his yellow mist, was a great man and a good guide, but he was not Apollo. He and his dray-horses led the way through the flats, cheerily, for a little time; we have other horses now flaming out "beyond the mighty sea."³

A victory over vapour of many kinds; Python-slaying in general. Look how the Python's jaws smoke as he falls

* There is a very wonderful, and almost deceptive imitation, of sunlight by Rubens at Berlin. It falls through broken clouds upon angels, the flesh being chequered with sunlight and shade.⁴

¹ [The title of Turner's picture exhibited in 1807, No. 479 in the National Gallery; one of the two which he bequeathed on condition that they should hang beside two by Claude.]

² [For Ruskin's notes on this picture, see Vol. XIII. p. 137.]

³ [See the passage from Hesiod translated above, §§ 6 and 8, pp. 393-396.]

⁴ [The reference is to the picture of "The Infant Christ, with St. John and angels."]

back between the rocks :—a vaporous serpent ! We will see who he was presently.

The public remonstrated loudly in the cause of Python :¹ “He had been so yellow, quiet, and pleasant a creature ; what meant these azure-shafted arrows, this sudden glare into darkness, this Iris message ;—Thaumantian ;—miracle-working ; scattering our slumber down in Cocytus ?” It meant much, but that was not what they should have first asked about it. They should have asked simply was it a true message ? Were these Thaumantian things so in the real universe ?

It might have been known easily they were. One fair dawn or sunset, obediently beheld, would have set them right ; and shown that Turner was indeed the only true speaker concerning such things that ever yet had appeared in the world. They would neither look nor hear ;—only shouted continuously, “Perish Apollo. Bring us back Python.”

§ 5. We must understand the real meaning of this cry, for herein rests not merely the question of the great right or wrong in Turner’s life, but the question of the right or wrong of all painting. Nay, on this issue hangs the nobleness of painting as an art altogether, for it is distinctively the art of colouring, not of shaping or relating. Sculptors and poets can do these, the painter’s own work is colour.²

Thus, then, for the last time, rises the question, what is the true dignity of colour ? We left that doubt a little while ago among the clouds, wondering what they had been made so scarlet for.³ Now Turner brings the doubt back to us, unescapable any more. No man, hitherto, had painted the clouds scarlet. Hesperid Æglé, and Erytheia,

¹ [Here Ruskin reverts to what, in the original scheme of his book, was its primary purpose—namely, the defence of Turner against the hostile criticisms which his later and more brilliantly-coloured pictures provoked : see Vol. III. pp. xxxiii., 635 *seq.* For specimens of the kind of criticisms which he here satirises, see *ibid.*, p. xxiv.]

² [Compare *Modern Painters*, vol. iii. (Vol. V. pp. 52–54), and vol. iv. (Vol. VI. p. 72).]

³ [See above, pp. 158, 161.]

throned there in the west, fade into the twilights of four thousand years, unconfessed. Here is at last one who confesses them, but is it well? Men say these Hesperides are sensual goddesses,—traitresses,—that the Graiæ are the only true ones. Nature made the western and the eastern clouds splendid in fallacy. Crimson is impure and vile; let us paint in black if we would be virtuous.

§ 6. Note, with respect to this matter, that the peculiar innovation of Turner was the perfection of the colour chord by means of *scarlet*. Other painters had rendered the golden tones, and the blue tones, of sky; Titian especially the last, in perfectness. But none had dared to paint, none seem to have seen, the scarlet and purple.

Nor was it only in seeing this colour in vividness when it occurred in full light, that Turner differed from preceding painters. His most distinctive innovation as a colourist was his discovery of the scarlet *shadow*. "True, there is a sunshine whose light is golden, and its shadow gray; but there is another sunshine, and that the purest, whose light is white, and its shadow scarlet." This was the essentially offensive, inconceivable thing, which he could not be believed in. There was some ground for the incredulity, because no colour is vivid enough to express the pitch of light of pure white sunshine, so that the colour given without the true intensity of light *looks* false.¹ Nevertheless, Turner could not but report of the colour truly. "I must indeed be lower in the key, but that is no reason why I should be false in the note." Here is sunshine which glows even when subdued; it has not cool shade, but fiery shade."* This is the glory of sunshine.

* Not, accurately speaking, shadow, but dark side. All shadow proper is negative in colour, but, generally, reflected light is warmer than direct light; and when the direct light is warm, pure, and of the highest intensity, its reflection is scarlet. Turner habitually, in his later sketches, used vermilion for his pen outline in effects of sun.²

¹ [On this subject, compare Vol. VI. pp. 48 *seq.*]

² [This may be seen in many of the sketches exhibited in the National Gallery.]

§ 7. Now, this scarlet colour,—or pure red, intensified by expression of light,—is, of all the three primitive colours, that which is most distinctive. Yellow is of the nature of simple light; blue connected with simple shade; but red is an entirely abstract colour. It is red to which the colour-blind are blind, as if to show us that it was not necessary merely for the service or comfort of man, but that there was a special gift or teaching in this colour. Observe, farther, that it is this colour which the sunbeams take in passing through the *earth's atmosphere*. The rose of dawn and sunset is the hue of the rays passing close over the earth. It is also concentrated in the blood of man.

§ 8. Unforeseen requirements have compelled me to disperse through various works, undertaken between the first and last portions of this essay, the examination of many points respecting colour, which I had intended to reserve for this place. I can now only refer the reader to these several passages,* and sum their import; which is briefly, that colour generally, but chiefly the scarlet, used with the

* The following collected system of the various statements made respecting colour in different parts of my works may be useful to the student :¹—

1st. Abstract colour is of far less importance than abstract form (Vol. I. Chap. v.)²; that is to say, if it could rest in our choice whether we would carve like Phidias (supposing Phidias had never used colour), or arrange the colours of a shawl like Indians,³ there is no question as to which power we ought to choose. The difference of rank is vast: there is no way of estimating or measuring it.

So, again, if it rest in our choice whether it will be great in invention of form, to be expressed only by light and shade, as Dürer, or great in invention and application of colour, caring only for ungainly form, as Bassano,⁴ there is still no question. Try to be Dürer, of the two. So again, if we have to give an account or description of anything—if it be an object of high interest—its form will be always what we should first tell. Neither leopard spots nor partridge's signify primarily in describing either beast or bird. But teeth and feathers do.

¹ [For a complete collation, see General Index. Here a few only of the principal passages are referred to.]

² [Chapter v. of Part ii. sec. i.; in this edition, Vol. III. pp. 158 *seq.*]

³ [Compare *A Joy for Ever*, § 173, and *Two Paths*, § 4 (Vol. XVI. pp. 158, 262).]

⁴ [Compare above, p. 341.]

hyssop, in the Levitical law, is the great sanctifying element of visible beauty, inseparably connected with purity and life.

I must not enter here into the solemn and far-reaching fields of thought which it would be necessary to traverse,

2. Secondly. Though colour is of less importance than form, if you introduce it at all, it must be right.¹

People often speak of the Roman school as if it were greater than the Venetian, because its colour is "subordinate."

Its colour is not subordinate. It is *bad*.

If you paint coloured objects, you must either paint them rightly or wrongly. There is no other choice. You may introduce as little colour as you choose—a mere tint of rose in a chalk drawing, for instance; or pale hues generally—as Michael Angelo in the Sistine Chapel. All such work implies feebleness or imperfection, but not necessarily error. But if you paint with full colour, as Raphael and Leonardo, you must either be true or false. If true, you will paint like a Venetian. If false, your form, supremely beautiful, may draw the attention of the spectator from the false colour, or induce him to pardon it—and, if ill-taught, even to like it; but your picture is none the greater for that. Had Leonardo and Raphael coloured like Giorgione, their work would have been greater, not less, than it is now.

3. To colour perfectly is the rarest and most precious (technical) power an artist can possess.² There have been only seven supreme colourists among the true painters whose works exist (namely, Giorgione, Titian, Veronese, l'intoret, Correggio, Reynolds, and Turner); but the names of great designers, including sculptors, architects, and metal-workers, are multitudinous. Also, if you can colour perfectly, you are sure to be able to do everything else if you like. There never yet was colourist who could not draw; but faculty of perceiving form may exist alone. I believe, however, it will be found ultimately that the *perfect* gifts of colour and form always go together. Titian's form is nobler than Dürer's, and more subtle; nor have I any doubt but that Phidias could have painted as nobly as he carved. But when the powers are not supreme, the wisest men usually neglect the colour-gift, and develop that of form.

I have not thought it worth while at present to enter into any examination of the construction of Turner's colour system, because the public is at present so unconscious of the meaning and nature of colour that they would not know what I was talking of. The more than ludicrous folly of the system of modern water-colour painting, in which it is assumed that every hue in the drawing may be beneficially washed into every other,³ must prevent, as long as it influences the popular mind, even incipient inquiry

¹ [See *Stones of Venice*, vol. ii. (Vol. X. pp. 172-173); Vol. XII. p. 301; and Vol. XIV. p. 13.]

² [See Vol. VI. p. 71; Vol. X. p. 106 n.; Vol. XII. pp. 482, 499; and compare *Ariadne Florentina*, § 21.]

³ [For other criticisms of this method, see Vol. XIII. p. 246, and Vol. XIV. p. 247.]

in order to detect the mystical connection between life and love, set forth in that Hebrew system of sacrificial religion to which we may trace most of the received ideas respecting sanctity, consecration, and purification. This only I must hint to the reader—for his own following out—that if

respecting colour-art. But for help of any solitary and painstaking student, it may be noted that Turner's colour is founded more on Correggio and Bassano than on the central Venetians; it involves a more tender and constant reference to light and shade than that of Veronese; and a more sparkling and gem-like lustre than that of Titian. I dislike using a technical word which has been disgraced by affectation, but there is no other word to signify what I mean in saying that Turner's colour has, to the full, Correggio's "morbidezza," including also, in due place, conditions of mosaic effect, like that of the colours in an Indian design, unaccomplished by any previous master in painting; and a fantasy of inventive arrangement corresponding to that of Beethoven in music.¹ In its concurrence with and expression of texture or construction of surfaces (as their bloom lustre, or intricacy) it stands unrivalled—no still-life painting by any other master can stand for an instant beside Turner's, when his work is of life-size, as in his numerous studies of birds and their plumage.² This "morbidezza" of colour is associated, precisely as it was in Correggio, with an exquisite sensibility to fineness and intricacy of curvature: curvature, as already noticed in the second volume,³ being to lines what gradation is to colours. This subject, also, is too difficult and too little regarded by the public to be entered upon here, but it must be observed that this quality of Turner's design, the one which of all is best expressible by engraving, has of all been least expressed, owing to the constant reduction or change of proportion in the plates. Publishers, of course, require generally their plates to be of one size (the plates in this book form an appalling exception to received practice in this respect⁴); Turner always made his drawings longer or shorter by half an inch, or more, according to the subject; the engravers contracted or expanded them to fit the books, with utter destruction of the nature of every curve in the design. Mere reduction necessarily involves such loss to some extent; but the degree in which it probably involves it has been curiously exemplified by the 61st Plate in this volume, reduced from a pen-drawing of mine, 18 inches long. Fig. 101 is a facsimile of the hook and piece of drapery, in the foreground, in my drawing, which is very nearly true to the Turner curves; compare them with the curves either in Plate 61, or in the published engraving in the England Series.

¹ [Compare Vol. X. p. 216; and for other musical analogies, see Vol. XIV. p. 26. For the soft mystery of Correggio, see Vol. IV. p. 197; Vol. VI. p. 81; and *Art of England*, § 76.]

² [As, for instance, in the drawings described in Vol. XIII. pp. 274, 370.]

³ [See Vol. IV. p. 89.]

⁴ [For the reductions of some of the Plates in this edition, necessitated by the size of the page, see above, p. xviii. n. Plates 61 and 80 have had to be reduced by about one-fourth.]

he earnestly examines the original sources from which our heedless popular language respecting the washing away of sins has been borrowed, he will find that the fountain, in which sins are indeed to be washed away, is that of love, not of agony.

§ 9. But, without approaching the presence of this deeper

Plate 80 is a portion of the foreground of the drawing of the Llanberis (England Series), also of its real size;¹ and interesting as showing the grace of Turner's curvature even when he was drawing fastest. It is a hasty drawing throughout, and after finishing the rocks and water, being apparently a little tired, he has struck out the broken fence of the watering-place for the cattle with a few impetuous dashes of the hand. Yet the curvature and grouping of line are still perfectly tender. How far the passage loses by reduction, may be seen by a glance at the published engraving.

† Colour, as stated in the text, is the purifying or sanctifying element of material beauty.²

Fig. 101

If so, how less important than form? Because, on form depends existence; on colour, only purity. Under the Levitical law, neither scarlet nor hyssop could purify the deformed.³ So, under all natural law, there must be rightly shaped members first; then sanctifying colour and fire in them.

Nevertheless, there are several great difficulties and oppositions of aspect in this matter, which I must try to reconcile now clearly and finally. As colour is the type of Love, it resembles it in all its modes of operation; and in practical work of human hands, it sustains changes of worthiness precisely like those of human sexual love. That love, when true, faithful, well-fixed, is eminently the sanctifying element of human life: without it, the soul cannot reach its fullest height or holiness. But if shallow, faithless, misdirected, it is also one of the strongest corrupting and degrading elements of life.

Between these base and lofty states of Love are the loveless states; some cold and horrible; others chaste, childish, or ascetic, bearing to careless thinkers the semblance of purity higher than that of Love.

So it is with the type of Love—colour. Followed rashly, coarsely, untruly, for the mere pleasure of it, with no reverence, it becomes a temptation, and leads to corruption. Followed faithfully, with intense but reverent passion, it is the holiest of all aspects of material things.

Between these two modes of pursuing it, come two modes of refusing

¹ [For other references to this drawing, see Vol. III. p. 410; Vol. XII. p. 376; and *Præterita*, ii. § 12. It was in the collection of Mr. Windus.]

² [Compare Vol. V. p. 321; Vol. VI. pp. 68, 69; and Vol. X. p. 172 n.]

³ [See Leviticus xxi. 16 *seq.*]

meaning of the sign, the reader may rest satisfied with the connection given him directly in written words, between the cloud and its bow.¹ The cloud, or firmament, as we have seen,² signifies the ministration of the heavens to man. That ministration may be in judgment or mercy—in the lightning, or the dew. But the bow, or colour of the cloud, signifies always mercy, the sparing of life; such ministry of the heaven as shall feed and prolong life. And as the sunlight, undivided, is the type of the wisdom and righteousness of God, so divided, and softened into colour by means of the firmamental ministry, fitted to every need of man, as to every delight, and becoming one chief source of human beauty, by being made part of the flesh of man;—thus divided, the sunlight is the type of the wisdom of God, becoming sanctification and redemption. Various in work—various in beauty—various in power.

it—one, dark and sensual; the other, statuesque and grave, having great aspect of nobleness.

Thus we have, first, the coarse love of colour, as a vulgar person's choice of gaudy hues in dress.

Then, again, we have the base disdain of colour, of which I have spoken at length elsewhere.³ Thus we have the lofty disdain of colour, as in Dürer's and Raphael's drawing: finally, the severest and passionate following of it, in Giorgione and Titian.

5. Colour is, more than all elements of art, the reward of veracity of purpose. This point respecting it I have not noticed before, and it is highly curious. We have just seen that in giving an account of anything for its own sake, the most important points are those of form. Nevertheless, the form of the object is its own attribute; special, not shared with other things. An error in giving an account of it does not necessarily involve wider error.

But its colour is partly its own, partly shared with other things round it. The hue and power of all broad sunlight is involved in the colour it has cast upon this single thing; to falsify that colour, is to misrepresent and break the harmony of the day: also, by what colour it bears, this single object is altering hues all round it; reflecting its own into them, displaying them by opposition, softening them by repetition; one

¹ [Genesis ix. 13.]

² [See ch. vi. of *Modern Painters*, vol. iv. (Vol. VI. pp. 106 seq.).]

³ [See Vol. V. pp. 53–55; Vol. VI. pp. 67–69; and *Stones of Venice*, vol. ii. (Vol. X. pp. 109–110).]

80. Rocks at Rest

81 Rocks in Forest

Colour is, therefore, in brief terms, the type of love. Hence it is especially connected with the blossoming of the earth; and again, with its fruits; also, with the spring and fall of the leaf, and with the morning and evening of the day, in order to show the waiting of love about the birth and death of man.

§ 10. And now, I think, we may understand, even far away in the Greek mind, the meaning of that Contest of Apollo with the Python. It was a far greater contest than that of Hercules with Ladon. Fraud and avarice might be overcome by frankness and force; but this Python was a darker enemy, and could not be subdued but by a greater god. Nor was the conquest slightly esteemed by the victor deity. He took his great name from it thenceforth—his prophetic and sacred name—the Pythian.

falsehood in colour in one place, implies a thousand in the neighbourhood. Hence, there are peculiar penalties attached to falsehood in colour, and peculiar rewards granted to veracity in it. Form may be attained in perfectness by painters who, in their course of study, are continually altering or idealizing it; but only the sternest fidelity will reach colouring. Idealize or alter in that, and you are lost. Whether you alter by abasing or exaggerating,—by glare, or by decline, one fate is for you—ruin. Violate truth wilfully in the slightest particular, or, at least, get into the habit of violating it, and all kinds of failure and error will surround and hunt you to your fall.

Therefore, also, as long as you are working with form only, you may amuse yourself with fancies; but colour is sacred—in that you must keep to facts. Hence the apparent anomaly that the only schools of colour are the schools of Realism. The men who care for form only, may drift about in dreams of Spiritualism; but a colourist must keep to substance. The greater his power in colour enchantment, the more stern and constant will be his common sense. Fuseli may wander wildly among gray spectra,¹ but Reynolds and Gainsborough must stay in broad daylight, with pure humanity. Velasquez, the greatest colourist, is the most accurate portrait painter of Spain;² Holbein, the most accurate portrait painter, is the only colourist of Germany; and even Tintoret had to sacrifice some of the highest qualities of his colour before he could give way to the flights of wayward though mighty imagination, in which his mind rises or declines from the royal calm of Titian.

¹ [Compare Vol. V. p. 108 ("poor fumigatory Fuseli").]

² [Compare *Lectures on Art*, § 177. For Holbein as a colourist, see *Lectures on Landscape*, § 65.]

It could, therefore, be no merely devouring dragon—no mere wild beast with scales and claws. It must possess some more terrible character to make conquest over it so glorious. Consider the meaning of its name, “THE CORRUPTER.” That Hesperid dragon was a treasure-guardian. This is the treasure-destroyer,—where moth and rust doth corrupt¹—the worm of eternal decay.

Apollo’s contest with him is the strife of purity with pollution; of life with forgetfulness; of love, with the grave.

§ 11. I believe this great battle stood, in the Greek mind, for the type of the struggle of youth and manhood with deadly sin—venomous, infectious, irrecoverable sin. In virtue of his victory over this corruption, Apollo becomes thenceforward the guide; the witness; the purifying and helpful God. The other gods help waywardly, whom they choose. But Apollo helps always: he is by name, not only Pythian, the conqueror of death; but Pæan—the healer of the people.²

Well did Turner know the meaning of that battle: he has told its tale with fearful distinctness. The Mammon dragon was armed with adamant; but this dragon of decay is a mere colossal worm: wounded, he bursts asunder in the midst,* and melts to pieces, rather than dies, vomiting smoke—a smaller serpent-worm rising out of his blood.

§ 12. Alas, for Turner! This smaller serpent-worm, it seemed, he could not conceive to be slain. In the midst of all the power and beauty of nature, he still saw this death-worm writhing among the weeds. A little thing now, yet

* Compare the deaths of Jehoram, Herod, and Judas.³

¹ [Matthew vi. 20.]

² [On the signification of Apollo as “the Pythian”—so named “from his chief enemy, the Python, slain”—see *Queen of the Air*, § 53, and compare *Time and Tide*, § 61; the Python itself being called “the corrupter,” from *πύθω* (to rot); the name “Pythian” being given to Apollo, who slew the corrupter. On the title *Ilalav* (Pæan, the physician of the gods), the name being given to Apollo in virtue of his healing office, see *Ethics of the Dust*, § 114.]

³ [2 Kings ix. 24–26; Acts xii. 21–23; Acts i. 18.]

enough: you may see it in the foreground of the Bay of Baiæ, which has also in it the story of Apollo and the Sibyl; Apollo giving love; but not youth, nor immortality: you may see it again in the foreground of the Lake Avernus—the Hades lake—which Turner surrounds with delicatest beauty, the Fates dancing in circle; but in front, is the serpent beneath the thistle and the wild thorn. The same Sibyl, Deiphobe, holding the golden bough.¹ I cannot get at the meaning of this legend of the bough; but it was, assuredly, still connected, in Turner's mind, with that help from Apollo. He indicated the strength of his feeling at the time when he painted the Python contest, by the drawing exhibited the same year, of the Prayer of Chryses.² There the priest is on the beach alone, the sun setting. He prays to it as it descends; flakes of its sheeted light are borne to him by the melancholy waves, and cast away with sighs upon the sand.

How this sadness came to be persistent over Turner, and to conquer him, we shall see in a little while. It is enough for us to know at present that our most wise and Christian England, with all her appurtenances of school-porch and church-spire, had so disposed her teaching as to leave this somewhat notable child of hers without even cruel Pandora's gift.

He was without hope.

True daughter of Night, Hesperid Æglé was to him; coming between Censure, and Sorrow,—and the Destinies.³

§ 13. What, for us, his work yet may be, I know not. But let not the real nature of it be misunderstood any more.

He is distinctively, as he rises into his own peculiar strength, separating himself from all men who had painted

¹ [For the "Bay of Baiæ" (No. 505 in the National Gallery), see Vol. XIII. pp. 131-135; and for the "Golden Bough," the view overlooking Lake Avernus (now at Dublin), *ibid.*, p. 133. The picture is given as a frontispiece to J. G. Frazer's *The Golden Bough* (2nd ed., 3 vols., 1900)—a treatise on the meaning and history of the legend.]

² [For this drawing (exhibited in 1811), see Vol. XIII. p. 446.]

³ [See above, p. 394.]

forms of the physical world before,—the painter of the loveliness of nature, with the worm at its root : Rose and cankerworm,—both with his utmost strength ; the one *never* separate from the other.

In which his work was the true image of his own mind.

I would fain have looked last at the rose ; but that is not the way Atropos will have it, and there is no pleading with her.

So, therefore, first of the rose.

§ 14. That is to say, of this vision of the loveliness and kindness of Nature, as distinguished from all visions of her ever received by other men. By the Greek she had been distrusted. She was to him Calypso, the Concealer, Circe, the Sorceress. By the Venetian, she had been dreaded. Her wildernesses were desolate ; her shadows stern. By the Fleming, she had been despised ; what mattered the heavenly colours to him ? But at last, the time comes for her loveliness and kindness to be declared to men. Had they helped Turner, listened to him, believed in him, he had done it wholly for them. But they cried out for Python, and Python came ; came literally as well as spiritually ; all the perfectest beauty and conquest which Turner wrought is already withered. The cankerworm stood at his right hand, and of all his richest, most precious work, there remains only the shadow. Yet that shadow is more than other men's sunlight ; it is the scarlet shade, shade of the Rose. Wrecked, and faded, and defiled, his work still, in what remains of it, or may remain, is the loveliest ever yet done by man, in imagery of the physical world. Whatsoever is there of fairest, you will find recorded by Turner, and by him alone.

§ 15. I say *you* will find, not knowing to how few I speak ; for in order to find what is fairest, you must delight in what is fair ; and I know not how few or how many there may be who take such delight. Once I could speak joyfully about beautiful things, thinking to be understood ;—now I cannot any more ; for it seems to me that

no one regards them. Wherever I look or travel in England or abroad, I see that men, wherever they can reach, destroy all beauty. They seem to have no other desire or hope but to have large houses and to be able to move fast. Every perfect and lovely spot which they can touch, they defile.*

§ 16. Nevertheless, though not joyfully, or with any hope of being at present heard, I would have tried to enter here into some examination of the right and worthy effect of beauty in Art upon human mind, if I had been myself able to come to demonstrable conclusions. But the question is so complicated with that of the enervating influence of all luxury,¹ that I cannot get it put into any tractable compass. Nay, I have many inquiries to make, many difficult passages of history to examine, before I can determine the just limits of the hope in which I may permit myself to continue to labour in any cause of Art.²

Nor is the subject connected with the purpose of this book. I have written it to show that Turner is the greatest landscape painter who ever lived; and this it has sufficiently accomplished. What the final use may be to men, of landscape painting, or of any painting, or of natural beauty, I do not yet know. Thus far, however, I *do* know.³

* Thus, the railroad bridge over the Fall of Schaffhausen, and that round the Clarens shore of the lake of Geneva, have destroyed the power of two pieces of scenery of which nothing can ever supply the place, in appeal to the higher ranks of European mind.⁴

¹ [Compare Vol. III. p. 21; Vol. XI. p. 5; Vol. VIII. p. 98; and Vol. XVI. p. 125.]

² [On this passage, compare the Introduction, above, p. lvi.]

³ [Here Ruskin resumes the discussion promised in Vol. V. p. 384.]

⁴ [Compare *Art of England*, § 208. The railroad from Bâle to the Lake of Constance, crossing the Rhine at Schaffhausen, had just been constructed at the time Ruskin wrote; for the building of the line on the Lake of Geneva, see Vol. VI. p. 455, and compare *Sesame and Lilies*, § 35, and *Art of England*. The footnote as it stands was compressed from a larger passage in the first draft, which formed part of the main text, and read:—

“The Alps seem to me beautiful to behold; men consider that it will be on the whole pleasanter to pass under them in a tunnel. The Rhine, as I once supposed, was beautiful among its Schaffhausen rocks; but it was found cheaper to build a railroad bridge among the foam than in the deep water. The bridge is built and the pleased world passes over it—content with a sight of a film of spray on right or left hand for the space of five seconds of time.”]

§ 17. Three principal forms of asceticism have existed in this weak world. Religious asceticism, being the refusal of pleasure and knowledge for the sake (as supposed) of religion; seen chiefly in the Middle Ages. Military asceticism, being the refusal of pleasure and knowledge for the sake of power; seen chiefly in the early days of Sparta and Rome. And monetary asceticism, consisting in the refusal of pleasure and knowledge for the sake of money; seen in the present days of London and Manchester.

“We do not come here to look at the mountains,” said the Carthusian to me at the Grande Chartreuse.¹ “We do not come here to look at the mountains,” the Austrian generals would say, encamping by the shores of Garda. “We do not come here to look at the mountains,” so the thriving manufacturers tell me, between Rochdale and Halifax.

§ 18. All these asceticisms have their bright and their dark sides. I myself like the military asceticism best, because it is not so necessarily a refusal of general knowledge as the two others, but leads to acute and marvellous use of mind, and perfect use of body. Nevertheless, none of the three are a healthy or central state of man. There is much to be respected in each, but they are not what we should wish large numbers of men to become. A monk of La Trappe, a French soldier of the Imperial Guard, and a thriving mill-owner, supposing each a type, and no more than a type, of his class, are all interesting specimens of humanity, but narrow ones,—so narrow that even all the three together would not make up a perfect man. Nor does it appear in any way desirable that either of the three classes should extend itself so as to include a majority of the persons in the world, and turn large cities into mere groups of monastery, barracks, or factory. I do not say that it may not be desirable that one city, or one country, sacrificed for the good of the rest, should become a mass

¹ [See *Stones of Venice*, vol. iii. (Vol. XI. p. 223).]

of barracks or factories. Perhaps, it may be well that this England should become the furnace of the world;¹ so that the smoke of the island, rising out of the sea, should be seen from a hundred leagues away, as if it were a field of fierce volcanoes; and every kind of sordid, foul, or venomous work which, in other countries, men dreaded or disdained, it should become England's duty to do,—becoming thus the offscourer of the earth, and taking the hyena instead of the lion upon her shield. I do not, for a moment, deny this; but, looking broadly, not at the destiny of England,² nor of any country in particular, but of the world, this is certain—that men exclusively occupied either in spiritual reverie, mechanical destruction, or mechanical productiveness,³ fall below the proper standard of their race, and enter into a lower form of being; and that the true perfection of the race, and, therefore, its power and happiness, are only to be attained by a life which is neither speculative nor productive;⁴ but essentially contemplative and protective, which (A) does not lose itself in the monk's vision or hope, but delights in seeing present and real things as they truly are; which (B) does not mortify itself for the sake of obtaining powers of destruction, but seeks the more easily attainable powers of affection, observance, and protection; which (C), finally, does not mortify itself with a view to productive accumulation, but delights itself in peace, with its appointed portion. So that the things to be desired for man in a healthy state, are that he should not see dreams, but realities; that he should not destroy

¹ [This possibility of "the destiny of England" was often stated by Ruskin; see, for instance, *Unto this Last*, § 81; *Time and Tide*, § 10; *Sesame and Lilies*, § 83; *Lectures on Art*, § 123; *Fors Clavigera*, Letter 35; and compare below, p. 458.]

² [From this point, down to the end of the chapter, was reprinted by Ruskin, with some alterations and rearrangement, in his *Notes on his Drawings by Turner* (see Vol. XIII. p. 497). Variations of substance are given here in footnotes; while minor alterations will be found noted in the Bibliographical Note at p. lxxv.]

³ [For Ruskin's views on this subject, see Vol. XII. p. 68 n.; *Munera Pulveris*, § 109 n.; *Time and Tide*, § 103; *Crown of Wild Olive*, § 2; and *Lectures on Art*, § 123.]

⁴ [In the reprint of this passage in the *Turner Notes* (1878) Ruskin here added a footnote:—

“‘Mechanically,’ always to be understood; the ‘produce’ of the earth for daily bread being always gleaned and stored to its last grain.”]

life, but save it; and that he should be not rich, but content.

§ 19. Towards which last state of contentment, I do not see that the world is at present approximating. There are, indeed, two forms of discontent: one laborious, the other indolent and complaining. We respect the man of laborious desire, but let us not suppose that his restlessness is peace, or his ambition meekness. It is because of the special connection of meekness with contentment that it is promised that the meek shall "inherit the earth."¹ Neither covetous men, nor the Grave, can *inherit*² anything;* they can but consume. Only contentment can possess.

§ 20. The most helpful and sacred work, therefore, which can at present be done for humanity, is to teach people (chiefly by example, as all best teaching must be done) not how "to better themselves," but how to "satisfy themselves." It is the curse of every evil nation and evil creature to eat, and *not* be satisfied.³ The words of blessing are, that they shall eat and be satisfied. And as there is only one kind of water which quenches all thirst, so there is only one kind of bread which satisfies all hunger—the bread of justice, or righteousness; which hungering after, men shall always be filled, that being the bread of heaven; but hungering after the bread, or wages, of unrighteousness, shall not be filled, that being the bread of Sodom.

* "There are three things that are never satisfied, yea, four things say not, It is enough: the grave; and the barren womb; the earth that is not filled with water; and the fire, that saith not, It is enough!" [Proverbs xxx. 15, 16.]

¹ [Matthew v. 5.]

² [In the reprint in the *Turner Notes* (1878) Ruskin here added a footnote:—

"These italics and those henceforward found, are put in this reprint to mark what I now wish especially to be noticed. I would not use them in my first text, which I intended to be read as a whole, with equal attention. But the then supplementary notes are now of so much more importance to the general public than the text, that I print them in the same type."

The italics of 1878 are here indicated below the text, as they were not adopted in the edition of 1888; in accordance with which the type of the notes remains that of the original editions.]

³ [Deuteronomy xiv. 29, and Psalms xxii. 26. For the following references, see John iv. 14 and vi. 35.]

§ 21. And, in order to teach men how to be satisfied, it is necessary fully to understand the art and joy of humble life,—this, at present, of all arts or sciences being the one most needing study. Humble life,—that is to say, proposing to itself no future exaltation, but only a sweet continuance;¹ not excluding the idea of foresight, but wholly of fore-sorrow, and taking no troublous thought for coming days;² so, also, not excluding the idea of providence, or provision,* but wholly of accumulation;—the life of domestic affection and domestic peace, full of sensitiveness to all elements of costless and kind pleasure;—therefore, chiefly to the loveliness of the natural world.

§ 22. What length and severity of labour may be ultimately found necessary for the procuring of the due comforts of life, I do not know; neither what degree of refinement it is possible to unite with the so-called servile occupations of life:³ but this I know, that right economy of labour will, as it is understood, assign to each man as much as it will be healthy for him, and no more; and that no refinements are desirable which cannot be connected with toil.

I say, first, that due economy of labour will assign to each man the share which is right. Let no technical labour be wasted on things useless or unpleasurable;† and let all

* A bad word, being only “foresight” again in Latin; but we have no other good English word for the sense into which it has been warped.

† I cannot repeat too often (for it seems almost impossible to arouse the public mind in the least to a sense of the fact) that the root of all benevolent and helpful action towards the lower classes consists in the wise direction of purchase;⁴ that is to say, in spending money, as far as possible, only for products of healthful and natural labour. All work with fire is more or less harmful and degrading; so also mine, or machine labour. They at present develop more intelligence than rural labour, but this is only because no education, properly so called, being given to the lower classes, those occupations are best for them which compel them to attain some accurate knowledge, discipline them in presence of mind, and bring

¹ [Among other passages in which Ruskin enforces this rule of life, see *Modern Painters*, vol. iii. (Vol. V. pp. 382, 383), and *Sesame and Lilies*, §§ 3-4, 42.]

² [See Matthew vi. 34.]

³ [On this subject, compare *Munera Pulveris*, § 109, and *Time and Tide*, § 109.]

⁴ [For an earlier enforcement of this principle, see *A Joy for Ever*, § 119 (Vol. XVI. p. 102).]

physical exertion, so far as possible, be utilised, and it will be found no man need ever work more than is good for him. I believe an immense gain in the bodily health and happiness of the upper classes would follow on their steadily endeavouring, however clumsily, to make the physical exertion they now necessarily take in amusements, definitely

them within spheres in which they may raise themselves to positions of command. Properly taught, a ploughman ought to be more intelligent, as well as more healthy, than a miner.

Every nation which desires to ennoble itself should endeavour to maintain as large a number of persons as possible by rural and maritime labour, including fishing. I cannot in this place enter into consideration of the relative advantages of different channels of industry. Any one who sincerely desires to act upon such knowledge will find no difficulty in obtaining it.

I have also several series of experiments and inquiries to undertake before I shall be able to speak with security on certain points connected with education; but I have no doubt that every child in a civilized country should be taught the first principles of natural history, physiology, and medicine; also to sing perfectly, so far as it has capacity, and to draw¹ any definite form accurately, to any scale.²

These things it should be taught by requiring its attendance at school not more than three hours a day, and less if possible (the best part of children's education being in helping their parents and families). The other elements of its instruction ought to have respect to the trade by which it is to live.

Modern systems of improvement are too apt to confuse the recreation of the workman with his education. He should be educated for his work before he is allowed to undertake it; and refreshed and relieved while he practises it.

Every effort should be made to induce the adoption of a national costume.³ Cleanliness and neatness in dress ought always to be rewarded by some gratification of personal pride; and it is the peculiar virtue of a national costume that it fosters and gratifies the wish to look well, without inducing the desire to look better than one's neighbours—or the hope, peculiarly English, of being mistaken for a person in a higher position of life.⁴ A costume may indeed become coquettish, but rarely indecent or vulgar; and though a French *bonne* or Swiss farm-girl may dress so as sufficiently to mortify her equals, neither of them ever desires or expects to be mistaken for her mistress.

¹ [Compare *A Joy for Ever*, § 155 (Vol. XVI. pp. 144-145).]

² [In the reprint in the *Turner Notes* (1878) this and the preceding paragraph were printed in italics.]

³ [On the importance of "nobleness of dress" in art, compare Vol. XVI. p. 52; on the moral value of a national costume, see *Lectures on Art*, § 79; and *Art of England*, § 23.]

⁴ [Compare *Two Paths*, § 96 (Vol. XVI. p. 343), and Ruskin's evidence to the Public Institutions Committee, Questions 103, 118 (*ibid.*, pp. 484, 486).]

serviceable. It would be far better, for instance, that a gentleman should mow his own fields, than ride over other people's.¹

§ 23. Again, respecting degrees of possible refinement, I cannot yet speak positively, because no effort has yet been made to teach refined habits to persons of simple life.

The idea of such refinement has been made to appear absurd, partly by the foolish ambition of vulgar persons in low life, but more by the worse than foolish assumption, acted on so often by modern advocates of improvement, that "education" means teaching Latin, or algebra, or music, or drawing, instead of developing or "drawing out" the human soul.²

It may not be the least necessary that a peasant should know algebra, or Greek, or drawing. But it may, perhaps, be both possible and expedient that he should be able to arrange his thoughts clearly, to speak his own language intelligibly, to discern between right and wrong, to govern his passions, and to receive such pleasures of ear or sight as his life may render accessible to him. I would not have him taught the science of music; but most assuredly I would have him taught to sing. I would not teach him the science of drawing; but certainly I would teach him to see; without learning a single term of botany, he should know accurately the habits and uses of every leaf and flower in his fields; and unencumbered by any theories of moral or political philosophy, he should help his neighbour, and disdain a bribe.

§ 24. Many most valuable conclusions respecting the degree of nobleness and refinement which may be attained in servile or in rural life may be arrived at by careful study of the noble writings of Blitzius (Jeremias Gotthelf), which contain a record of Swiss character not less valuable in its

¹ [Compare the note on p. 341, above.]

² [That education should be mainly an ethical process, and not a machinery for the acquisition of knowledge, was a constant theme with Ruskin: compare Vol. XI. p. 204, and *Munera Puveris*, § 106.]

fine truth than that which Scott has left of the Scottish. I know no ideal characters of women, whatever their station, more majestic than that of Freneli, in *Ulric le Valet de Ferme*, and *Ulric le Fermier*; or of Elise, in the *Tour de Jacob*; nor any more exquisitely tender and refined than that of Aenneli in the *Fromagerie*, and Aenneli in the *Miroir des Paysans*.*

§ 25. How far this simple and useful pride, this delicate innocence, might be adorned, or how far destroyed, by higher intellectual education in letters or the arts, cannot be known without other experience than the charity of men has hitherto enabled us to acquire.

All effort in social improvement is paralyzed, because no one has been bold or clear-sighted enough to put and press home this radical question: "What is indeed the noblest tone and reach of life for men; and how can the possibility of it be extended to the greatest numbers?" It is answered, broadly and rashly, that wealth is good; that knowledge is good; that art is good; that luxury is good. Whereas none of them are good in the abstract, but good only if rightly received. Nor have any steps whatever been yet securely taken,—nor, otherwise than in the resultless rhapsody of moralists,—to ascertain what luxuries and what learning it is either kind to bestow, or wise to desire. This, however, at least we know, shown clearly by the history of all time, that the arts and sciences, ministering to the pride of nations, have invariably hastened their ruin;¹ and this, also, without venturing to say that I know, I nevertheless firmly believe, that the same arts and sciences will

* This last book should be read carefully by all persons interested in social questions. It is sufficiently dull as a tale, but is characterised throughout by a restrained tragic power of the highest order; and it would be worth reading, were it only for the story of Aenneli, and for the last half page of its close.²

¹ [See on this point Vol. XVI. pp. 197, 263.]

² [For a note on Gotthelf, see Vol. VI. p. 172. The *Mirror of Peasants* is specially referred to in *Fors Clavigera*, Letter 30; and the character of Freneli in Letters 91 and 94.]

tend as distinctly to exalt the strength and quicken the soul of every nation which employs them to increase the comfort of lowly life, and grace with happy intelligence the unambitious courses of honourable toil.

Thus far, then, of the Rose.

§ 26. Last, of the Worm.

I said that Turner painted the labour of men, their sorrow, and their death. This he did nearly in the same tones of mind which prompted Byron's poem of *Childe Harold*, and the loveliest result of his art, in the central period of it, was an effort to express on a single canvas the meaning of that poem.¹ It may be now seen, by strange coincidence, associated with two others—Caligula's Bridge and the Apollo and Sibyl; the one illustrative of the vanity of human labour, the other of the vanity of human life.* He painted these, as I said, in the same tone of mind which formed the *Childe Harold* poem, but with different capacity: Turner's sense of beauty was perfect; deeper, therefore, far than Byron's; only that of Keats and Tennyson being comparable with it. And Turner's love of truth was as stern and patient as Dante's; so that when over these great capacities come the shadows of despair, the wreck is infinitely sterner and more sorrowful. With no sweet home for his childhood—friendless in youth, loveless in manhood,—and hopeless in death, Turner was what Dante might have been, without the "bello ovile," without

* "The Cumæan Sibyl, Deiphobe, was, in her youth, beloved by Apollo; who promising to grant her whatever she would ask, she took up a handful of earth, and asked that she might live as many years as there were grains of dust in her hand. She obtained her petition. Apollo would have granted her perpetual youth in return for her love, but she denied him, and wasted into the long ages—known, at last, only by her voice."—(See my *Notes on the Turner Gallery*.)

¹ ["*Childe Harold's Pilgrimage*," exhibited in 1832, No. 516 in the National Gallery: see *Notes on the Turner Gallery*, Vol. XIII. pp. 140-145. "*Caligula's Palace and Bridge*," exhibited in 1831, is No. 512 in the National Gallery; the "*Bay of Baiæ, with Apollo and the Sibyl*," exhibited in 1823, is No. 505; it is fully described in the *Notes on the Turner Gallery*, Vol. XIII. pp. 131-135.]

Casella,¹ without Beatrice, and without Him who gave them all, and took them all away.

§ 27. I will trace this state of his mind farther, in a little while. Meantime, I want you to note only the result upon his work;—how, through all the remainder of his life, wherever he looked, he saw ruin.

Ruin, and twilight. What was the distinctive effect of light which he introduced, such as no man had painted before? Brightness, indeed, he gave, as we have seen, because it was true and right; but in this he only perfected what others had attempted. His own favourite light is not *Æglé*, but *Hesperid Æglé*. Fading of the last rays of sunset. Faint breathing of the sorrow of night.

§ 28. And fading of sunset, note also, on ruin. I cannot but wonder that this difference between Turner's work and previous art-conception has not been more observed. None of the great early painters draw ruins, except compulsorily. The shattered buildings introduced by them are shattered artificially, like models. There is no real sense of decay; whereas Turner only momentarily dwells on anything else than ruin. Take up the *Liber Studiorum*, and observe how this feeling of decay and humiliation gives solemnity to all its simplest subjects; even to his view of daily labour. I have marked its tendency in examining the design of the *Mill and Lock*,² but observe its continuance through the book. There is no exultation in thriving city, or mart, or in happy rural toil, or harvest gathering. Only the grinding at the mill, and patient striving with hard conditions of life. Observe the two disordered and poor farm-yards,³ cart, and ploughshare,

¹ [For the "bello ovile," see above, p. 376; and for Casella, Vol. XV. p. 205.]

² [See *Modern Painters*, vol. iv. (Vol. VI. pp. 16 *seq.* and Plate 19).]

³ [The "two farm-yards" are the Plates called "A Farm-Yard" and "The Rick-Yard" (the drawing for the former is No. 507 in the National Gallery). The "pastoral by the brook side" is the "Rustic Bridge" (No. 504 in the National Gallery). The drawing for "Hedging and Ditching" is No. 508; that for "The Water-Mill" is No. 505 (the Plate is reproduced in *Lectures on Landscape*); that for "Peat Bog, Scotland," No. 498; and that for "Mill near the Grand Chartreuse, Dauphiny," No. 866 (the Plate also reproduced in *Lectures on Landscape*). For other references to these Plates, see General Index, s. "Turner, *Liber Studiorum*."]]

and harrow rotting away: note the pastoral by the brook side, with its neglected stream and haggard trees, and bridge with the broken rail, and decrepit children—fever-struck—one sitting stupidly by the stagnant stream, the other in rags, and with an old man's hat on, and lame, leaning on a stick. Then the "Hedging and Ditching," with its bleak sky and blighted trees—hacked, and bitten, and starved by the clay soil into something between trees and firewood; its meanly-faced, sickly labourers—pollard labourers, like the willow trunk they hew; and the slatternly peasant-woman, with worn cloak and battered bonnet—an English Dryad. Then the water-mill, beyond the fallen steps, overgrown with the thistle: itself a ruin, mud-built at first, now propped on both sides;—the planks torn from its cattle-shed; a feeble beam, splintered at the end, set against the dwelling-house from the ruined pier of the water-course; the old mill-stone—useless for many a day—half-buried in slime, at the bottom of the wall; the listless children, listless dog, and the poor gleaner bringing her single sheaf to be ground. Then the "Peat Bog," with its cold, dark rain, and dangerous labour. And last and chief, the mill in the valley of the Chartreuse. Another than Turner would have painted the convent; but he had no sympathy with the hope, no mercy for the indolence of the monk. He painted the mill in the valley. Precipice overhanging it, and wildness of dark forest round; blind rage and strength of mountain torrent rolled beneath it,—calm sunset above, but fading from the glen, leaving it to its roar of passionate waters and sighing of pine-branches in the night.

§ 29. Such is his view of human labour. Of human pride, see what records.¹ Morpeth tower, roofless and black;

¹ [The drawing for "Morpeth" is No. 482 in the National Gallery. The "gate of old Winchelsea wall" is "East Gate, Winchelsea" (No. 488). The drawing for "Rievaulx Abbey" is No. 483; that for "Kirkstall Crypt" No. 484; "Dunstanborough," No. 485; "Chepstow," No. 494. "Lindisfarne" is "Holy Island Cathedral" (No. 481); the drawing for "Raglan" is No. 865 (see Vol. XIII. p. 644 for a note on the title). The drawing for "Cephalus and Procris" is No. 465 in

gate of old Winchelsea wall, the flock of sheep driven round it, not through it; and Rievaulx choir, and Kirkstall crypt; and Dunstanborough, wan above the sea; and Chepstow, with arrowy light through traceried windows; and Lindisfarne, with failing height of wasted shaft and wall; and last and sweetest, Raglan, in utter solitude, amidst the wild wood of its own pleasance; the towers rounded with ivy, and the forest roots choked with undergrowth, and the brook languid amidst lilies and sedges. Legends of gray knights and enchanted ladies keeping the woodman's children away at the sunset.

These are his types of human pride. Of human love: Procris, dying by the arrow; Hesperie, by the viper's fang; and Rizpah, more than dead, beside her children.

§ 30. Such are the lessons of the *Liber Studiorum*. Silent always with a bitter silence, disdaining to tell his meaning, when he saw there was no ear to receive it, Turner only indicated this purpose by slight words of contemptuous anger, when he heard of any one's trying to obtain this or the other separate subject as more beautiful than the rest. "What is the use of them," he said, "but together?"* The meaning of the entire book was

* Turner appears never to have desired, from any one, care in favour of his separate works. The only thing he would say sometimes was, "Keep them together."¹ He seemed not to mind how much they were injured, if only the record of the thought were left in them, and they were kept in the series which would give the key to their meaning. I never saw him, at my father's house, look for an instant at any of his own

the National Gallery; the Plate is reproduced in *Lectures on Landscape*; as also is "Æsacus and Hesperie." The drawing for "Rizpah" is No. 864 in the National Gallery. Here, again, for other references to the several plates, see General Index; and for "the lessons of the *Liber Studiorum*" compare Ruskin's letter to Professor Norton, Vol. XV. p. xxiv.]

¹ [Mr. W. G. Rawlinson records a similar remark. "Mr. Halsted tells me that Turner, once coming to his shop in Bond Street, found fault with him for breaking up sets of the *Liber*; and when he heard that some Plates sold habitually much better than others, he grunted out, 'A pack of geese! a pack of geese! Don't they know what *Liber Studiorum* means?'" (*Catalogue of the Liber Studiorum*, p. xlv.). For another reference to Turner's "earnest desire to arrange his works in connected groups," see preface to *The Harbours of England*, Vol. XII. p. 9. So also with regard to some of the "Rivers of England" series, see *ibid.*, p. 382.]

symbolized in the frontispiece, which he engraved with his own hand:¹ Tyre at sunset, with the Rape of Europa, indicating the symbolism of the decay of Europe by that of Tyre, its beauty passing away into terror and judgment (Europa being the mother of Minos and Rhadamanthus).*

drawings: I have watched him sitting at dinner nearly opposite one of his chief pictures²—his eyes never turned to it.

But the want of appreciation, nevertheless, touched him sorely; chiefly the not understanding his meaning. He tried hard one day for a quarter of an hour to make me guess what he was doing in the picture of Napoleon, before it had been exhibited, giving me hint after hint in a rough way: but I could not guess, and he would not tell me.³

* I limit myself in this book to mere indication of the tones of his mind, illustration of them at any length being as yet impossible. It will be found on examining the series of drawings made by Turner during the late years of his life, in possession of the nation, that they are nearly all made for the sake of some record of human power,⁴ partly victorious, partly conquered. There is hardly a single example of landscape painted for its own abstract beauty. Power and desolation, or soft pensiveness, are the elements sought chiefly in landscape; hence the later sketches are nearly all among mountain scenery, and chiefly of fortresses, villages or bridges and roads among the wildest Alps. The pass of the St. Gothard, especially, from his earliest days, had kept possession of his mind, not as a piece of mountain scenery, but as a marvellous road;⁵ and the great drawing which I have tried to illustrate with some care in this book, the last he made of the Alps with unfailing energy,⁶ was wholly made to show the surviving of this tormented path through avalanche and storm, from the day when he first drew its two bridges, in the *Liber Studiorum*.⁷ Plate 81, which is the piece of the torrent bed on the left, of the real size,⁸ where the stones of it appear just on the point of being swept away, and the ground we stand upon with them, completes the series of illustrations of this

¹ [Turner's drawing in ink and bistre over a completed etching of the frontispiece (evidently the guide for the engraver of the mezzotint work), is now, by the Vaughan Bequest, in the National Gallery, No. 863.]

² ["The Slave Ship": see Vol. III. p. 572.]

³ [For Ruskin's notes on the "Napoleon," see Vol. XIII. p. 160 and the other passages there noted. For other references to Turner's susceptibility to criticisms founded on want of understanding his purpose, see Ruskin's anecdote of the "Snow-storm," Vol. XIII. p. 161; and compare below, p. 453.]

⁴ [In the reprint in the *Turner Notes* (1878) the words "that they are nearly . . . human power" were put in italics.]

⁵ [See *Modern Painters*, vol. iv. (Vol. VI. pp. xxvi., 33-40, 269-275, and Plates 20, 21, 37).]

⁶ [Compare Vol. V. p. 296.]

⁷ [See Vol. VI. p. 40, where a piece of the etching done for *Liber Studiorum* (an unpublished Plate) is given. The Plate of the "Little Devil's Bridge" was published; the drawing is No. 476 in the National Gallery.]

⁸ [Here reduced by about one-fourth. The reprint had here "Drawing No. 66 in the Exhibition"; see Vol. XIII. p. 456.]

§ 31. I need not trace the dark clue farther, the reader may follow it unbroken through all his work and life, this

subject, for the present, sufficiently ; and, if compared with Plate 80,¹ will be serviceable, also, in showing how various in its grasp and its delight was this strange human mind, capable of all patience and all energy, and perfect in its sympathy, whether with wrath or quietness. Though lingering always with chief affection about the St. Gothard pass, he seems to have gleaned the whole of Switzerland for every record he could find of grand human effort of any kind ; I do not believe there is one baronial tower, one shattered arch of Alpine bridge, one gleaming tower of decayed village or deserted monastery, which he has not drawn ; in many cases, round and round, again and again, on every side. Now that I have done this work, I purpose, if life and strength are spared to me, to trace him through these last journeys, and take such record of his best-beloved places as may fully interpret the designs he left.² I have given in the three following plates an example of the kind of work which needs doing, and which, as stated in the preface, I have partly already begun.³ Plate 82 represents roughly two of Turner's memoranda of a bridge over the Rhine. They are quite imperfectly represented, because I do not choose to take any trouble about them on this scale. If I can engrave them at all, it must be of their own size ; but they are enough to give an idea of the way he used to walk round a place, taking sketch after sketch of its aspects, from every point or half-point of the compass. There are three other sketches of this bridge, far more detailed than these, in the National Gallery.

A scratched word on the back of one of them, "Rheinfels," which I knew could not apply to the Rheinfels near Bingen, gave me the clue to the place ; — an old Swiss town, seventeen miles above Basle, celebrated in Swiss history as the main fortress defending the frontier toward the Black Forest. I went there the moment I had got Turner's sketches arranged in 1858, and drew it with the pen (or point of brush, more difficult to manage, but a better instrument) on every side on which Turner had drawn it, giving every detail with servile accuracy, so as to show the exact modifications he made as he composed his subjects. Mr. Le Keux has beautifully copied two of these studies, Plates 83 and 84 ; the first of these is the bridge drawn from the spot whence Turner made his upper memorandum ; afterwards, he went down close to the fishing house, and took the second ; in which he unhesitatingly divides the Rhine by a strong pyramidal rock, in order to get a group of firm lines pointing to his main subject, the tower (compare § 12, p. 224, above) ; and throws a foaming mass of water away to the left, in order to give a better idea of the river's force ; the modifications of form in the tower itself are all skilful and majestic in the highest degree. The throwing the whole of it higher than the bridge,

¹ [For the subject, see above, § 8 n.]

² [An intention which was not to be fulfilled : see above, Introduction, p. lvi.]

³ [See above, p. 6 ; and compare the Introduction, pp. xxix., xxx., where Ruskin's studies at Rheinfelden are further described. The two sketches reproduced in Plate 82 are Nos. 87 and 89 in the National Gallery (see Vol. XIII. p. 222 for Ruskin's notes on them in 1867 when he had not yet identified the subject) ; the other three sketches of Rheinfelden, also showing the bridge, are Nos. 86, 88, and 90. In the lower sketch on Plate 82 the engraver has added the sky.]

83 The Bridge of Rhemfelden

thread of Atropos.* I will only point, in conclusion, to the intensity with which his imagination dwelt always on the three great cities of Carthage, Rome, and Venice—Carthage in connection especially with the thoughts and study which led to the painting of the Hesperides' Garden, showing the death which attends the vain pursuit of wealth; Rome showing the death which attends the vain pursuit of power; Venice, the death which attends the vain pursuit of beauty.

taking off the peak from its gable on the left, and adding the little roof-window in the centre, make it a perfectly noble mass instead of a broken and common one. I have added the other subject, Plate 84,—though I could not give the Turner drawing which it illustrates,¹—merely to show the kind of scene which modern ambition and folly are destroying, throughout Switzerland. In Plate 83, a small dark tower is seen in the distance, just on the left of the tower of the bridge. Getting round nearly to the foot of it, on the outside of the town, and then turning back so as to put the town walls on your right, you may, I hope, still see the subject of the third plate; the old bridge over the moat, and older wall and towers; the stork's nest on the top of the nearest one; the moat itself, now nearly filled with softest grass and flowers; a little mountain brook rippling down through the midst of them, and the first wooded promontory of the Jura beyond. Had Rheinfelden been a place of the least mark, instead of an early ruinous village, it is just this spot of ground which, costing little or nothing, would have been made its railroad station, and its refreshment-room would have been built out of the stones of the towers.

* I have not followed out, as I ought to have done, had the task been less painful, my assertion that Turner had to paint not only the labour and the sorrow of men, but their death. There is no form of violent death which he has not painted. Pre-eminent in many things, he is pre-eminent also, bitterly, in this. Dürer and Holbein drew the skeleton in its questioning; but Turner, like Salvator, as under some strange fascination or captivity, drew it at its work. Flood, and fire, and wreck, and battle, and pestilence, and solitary death, more fearful still. The noblest of all the plates of the *Liber Studiorum*, except the *Via Mala*, is one² engraved with his own hand, of a single sailor, yet living, dashed in the night against a granite coast,—his body and outstretched hands just seen in the trough of a mountain wave, between it and the overhanging wall of rock, hollow, polished, and pale with dreadful cloud and grasping foam.

And remember also, that the very sign in heaven itself which, truly

¹ [The Turner drawing has not been identified. The subject of Ruskin's drawing can no longer be seen. Rheinfelden has become the centre of salt works and breweries, and has outgrown its old boundaries. The old bridge, however, still stands (in company with a new iron one). The tower shown in the Plate also survives, but the town walls have for the most part been demolished, and the moat is filled up.]

² [The reprint had here "No. 72 in the Exhibition": see Vol. XIII. pp. 43, 461.]

How strangely significant, thus understood, those last Venetian dreams of his become, themselves so beautiful and so frail; wrecks of all that they were once—twilights of twilight!

§ 32. Vain beauty; yet not all in vain. Unlike in birth, how like in their labour, and their power over the future, these masters of England and Venice—Turner and Giorgione. But ten years ago, I saw the last traces of

understood, is the type of love, was to Turner the type of death. The scarlet of the clouds was his symbol of destruction. In his mind it was the colour of blood. So he used it in the Fall of Carthage. Note his own written words—

“ While o’er the western wave the *ensanguined* sun,
In gathering huge a stormy signal spread,
And set portentous.”¹

So he used it in the Slaver, in the Ulysses, in the Napoleon, in the Goldau;² again and again in slighter hints and momentary dreams, of which one of the saddest and most tender is a little sketch of dawn, made in his last years. It is a small space of level sea shore; beyond it a fair, soft light in the east; the last storm-clouds melting away, oblique into the morning air; some little vessel—a collier, probably—has gone down in the night, all hands lost; a single dog has come ashore. Utterly exhausted, its limbs failing under it, and sinking into the sand, it stands howling and shivering. The dawn clouds have the first scarlet upon them, a feeble tinge only, reflected with the same feeble blood-stain on the sand. (Plate 86.³)

The morning light is used with a loftier significance in a drawing made as a companion to the Goldau, engraved in the fourth volume. The Lake of Zug,⁴ which ripples beneath the sunset in the Goldau, is lulled in the level azure of early cloud; and the spire of Arth, which is there a dark point at the edge of the golden lake, is, in the opening light, seen pale against purple mountains. The sketches for these two subjects were, I doubt not, made from the actual effects of a stormy evening, and the next following daybreak; but both with earnest meaning.⁵ The crimson sunset lights the valley of rock tombs, cast upon it by the fallen Rossberg; but the sunrise gilds with its level rays the two peaks which protect the village that

¹ [For this picture, see Vol. XIII. p. 125.]

² [The reprint had here “No. 65 in the Exhibition”: see Vol. XIII. p. 455. The “Goldau” is Plate 50 in *Modern Painters*, vol. iv. (Vol. VI. p. 379).]

³ [This Plate (though prepared, but too late, for the original edition) was first introduced in that of 1888 (see above, p. lxix.). It is from a drawing in the possession of the Rev. W. Kingsley, known as “Dawn after the Wreck.”]

⁴ [The reprint had here “Drawing No. 64 in the Exhibition”: see Vol. XIII. p. 455.]

⁵ [For the sketches (in the National Gallery, Nos. 97, 98), see Vol. XIII. p. 202.]

87 The Lake of Zug.

the greatest works of Giorgione yet glowing¹ like a scarlet cloud, on the Fondaco de' Tedeschi.* And though that scarlet cloud (sanguigna e fiammeggiante, per cui le pitture cominciarono con dolce violenza a rapire il cuore delle genti²) may, indeed, melt away into paleness of night, and Venice herself waste from her islands as a wreath of wind-driven foam fades from their weedy beach;—that which she won of faithful light and truth shall never pass away. Deiphobe

gives name to Switzerland; and the orb itself breaks first through the darkness on the very point of the pass to the high lake of Egeri, where the liberties of the cantons were won by the battle-charge of Morgarten. (Plate 87.³)

* I have engraved, at the beginning of this chapter, one of the fragments of these frescoes, preserved, all imperfectly indeed, yet with some feeling of their nobleness, by Zanetti,⁴ whose words respecting them I have quoted in the text. The one I saw was the first figure given in his book; the one engraven in my Plate, the third, had wholly perished; but even this record of it by Zanetti is precious. What imperfections of form exist in it, too visibly, are certainly less Giorgione's than the translator's; nevertheless, for these very faults, as well as for its beauty, I have chosen it, as the best type I could give of the strength of Venetian art; which was derived, be it remembered always, from the acceptance of natural truth, by men who loved beauty too well to think she was to be won by falsehood.

The words of Zanetti himself respecting Giorgione's figure of Diligence are of great value, as they mark the first article of Venetian faith: "Giorgione per tale o per altra che si fosse, contrassegnolla con quella spezie di mannaja, che tiene in mano; per altro tanto ci cercava le sole beilezze della natura, che poco pensando al costume, ritrasse quì una di quelle donne Friulane, che vengono per servire in Venezia; non alterandone nemmeno l' abito, e facendola alquanto attempata, quale forse ci la vedea;

¹ [In 1845 and again in 1850-1851: see *Modern Painters*, vol. i. (Vol. III. p. 212 and n.).]

² [The words are quoted from p. iv. of Zanetti's book: "Ella è pure la dura condizione il non poter far vedere su queste carte quella tinta sanguigna e fiammeggiante, che dà tanto sapore alle opere di questo pittore eccellente, primo inventore fra nostri di quell' egregio stile, per cui . . . gente."]

³ [This Plate also was first introduced in the edition of 1838.]

⁴ [*Varie Pitture a Fresco de' Principali Maestri Veneziani Ora la prima volta con le stampe pubblicate*, by Anton. Maria Zanetti (Venice, 1760). The first Plate in the book is the figure of a man, seated. The first four are by Giorgione; three are by Titian; seven by Tintoret; five by Zelotti; five by Veronese. The engravings are followed by "Notizie intorno alla presente raccolta." The passage quoted by Ruskin in his footnote is at pp. vi.-vii. The first three frescoes by Giorgione were on the Fondaco de' Tedeschi. The fourth ("Diligence")—the standing figure of a stalwart woman with a halberd on the watch—was painted at the entrance of Palazzo Grimani-Calergi (now Vendramin). The frescoes on the Fondaco de' Tedeschi were executed in 1507-1508, and are described by Vasari (vol. ii. p. 399. Bohn's translation).]

of the sea,—the Sun God measures her immortality to her by its sand. Flushed, above the Avernus of the Adrian lake, her spirit is still seen holding the golden bough; from the lips of the Sea Sibyl men shall learn for ages yet to come what is most noble and most fair; and, far away, as the whisper in the coils of the shell, withdrawn through the deep hearts of nations, shall sound for ever the enchanted voice of Venice.

senza voler sapere che per rappresentare le Virtù, si suole da' pittori belle e fresche giovani immaginare."

Compare this with what I have said of Titian's Magdalen. I ought in that place¹ to have dwelt upon the firm endurance of all terribleness which is marked in Titian's "Notomie" and in Veronese's "Marsyas."² In order to understand the Venetian mind entirely, the student should place a plate from that series of the Notomie always beside the best engraving he can obtain of Titian's "Flora."³

My impression is that the ground of the flesh in these Giorgione frescoes had been pure vermilion; little else was left in the figure I saw. Therefore, not knowing what power the painter intended to personify by the figure at the commencement of this chapter, I have called her, from her glowing colour, Hesperid Æglé.

¹ [Above, p. 296; and *Modern Painters*, vol. ii. (Vol. IV. p. 195 and n.).]

² [This is a folio volume of seventeen anatomical figures (skeletons in various attitudes) drawn by Titian, and engraved and edited by Dominico Bouavera, by whom (on the title-page) the book is dedicated—under the title *Notomie di Titiano*—to Signor Francesco Ghisilieri, Senator of Bologna. The volume is believed to have been published at Venice, 1680. It is not clear to what work of Veronese Ruskin refers as "Marsyas"; perhaps, to his drawing of Satyrs flayed by nymphs in the Dresden collection (see the reproduction of it at p. 38 of F. H. Meissner's *Veronese*, 1897).]

³ [In the Uffizi at Florence.]

Monte Rosa . Sunset.

CHAPTER XII

PEACE

§ 1. LOOKING back over what I have written, I find that I have only now the power of ending this work,—it being time that it should end, but not of “concluding” it; for it has led me into fields of infinite inquiry, where it is only possible to break off with such imperfect result as may, at any given moment, have been attained.

Full of far deeper reverence for Turner’s art than I felt when this task of his defence was undertaken (which may, perhaps, be evidenced by my having associated no other names with his—but of the dead—in my speaking of him throughout this volume*), I am more in doubt respecting the real use to mankind of that, or any other transcendent art; incomprehensible as it must always be to the mass of men. Full of far deeper love for what I remember of Turner himself, as I become better capable of understanding it, I find myself more and more helpless to explain his errors and his sins.

§ 2. His errors, I might say, simply. Perhaps, some day, people will again begin to remember the force of the old Greek word for sin; and to learn that all sin is in essence—“Missing the mark”; losing sight or consciousness

* It is proper, however, for the reader to know, that the title which I myself originally intended for this book was “*Turner and the Ancients*”;¹ nor did I purpose to refer in it to any other modern painters than Turner. The title was changed; and the notes on other living painters inserted in the first volume, in deference to the advice of friends, probably wise; for unless the change had been made, the book might never have been read at all. But, as far as I am concerned, I regretted the change then, and regret it still.

¹ [See on this subject, Vol. III. pp. xxxi., 608.]

of heaven; and that this loss may be various in its guilt; it cannot be judged by us. It is this of which the words are spoken so sternly, "Judge not"; which words people always quote, I observe, when they are called upon to "do judgment and justice."¹ For it is truly a pleasant thing to condemn men for their wanderings; but it is a bitter thing to acknowledge a truth, or to take any bold share in working out an equity. So that the habitual modern practical application of the precept "Judge not," is to avoid the trouble of pronouncing verdict by taking, of any matter, the pleasantest malicious view which first comes to hand, and to obtain licence for our own convenient iniquities, by being indulgent to those of others.

These two methods of obedience being just the two which are most directly opposite to the law of mercy and truth.

§ 3. "Bind them about thy neck."² I said, but now, that of an evil tree men never gathered good fruit.³ And the lesson we have finally to learn from Turner's life is broadly this, that all the power of it came of its mercy and sincerity; all the failure of it, from its want of faith. It has been asked of me, by several of his friends, that I should endeavour to do some justice to his character, mistaken wholly by the world. If my life is spared, I will.⁴ But that character is still, in many respects, inexplicable to me; the materials within my reach are imperfect; and my experience in the world not yet large enough to enable me to use them justly. His life is to be written by a biographer, who will, I believe, spare no pains in collecting the few scattered records which exist of a career so uneventful

¹ [Matthew vii. 1; Ezekiel xviii. 5.]

² [Proverbs iii. 3.]

³ [See above, p. 287.]

⁴ [Ruskin, however, never wrote *Turner's Life*, though he collected much material: see Vol. XIII. p. lvi. His references to Turner's life and character are scattered through his works; for a complete collation of them, see General Index. Some of the principal passages are: *Lectures on Architecture and Painting*, §§ 102 seq. (Vol. XII. pp. 129 seq.); *Pre-Raphaelitism*, §§ 30 seq. (*ibid.*, pp. 365 seq.); *Notes on his Drawings by Turner*, Vol. XIII. pp. 475 seq.; and *Dilecta*, *passim*. For other references to Thornbury's book, then in preparation, see *ibid.*, pp. 554, 555.]

and secluded. I will not anticipate the conclusions of this writer; but if they appear to me just, will endeavour afterwards, so far as may be in my power, to confirm and illustrate them; and, if unjust, to show in what degree.

§ 4. Which, lest death or illness should forbid me, this only I declare now of what I know respecting Turner's character. Much of his mind and heart I do not know;—perhaps never shall know. But this much I do: and if there is anything in the previous course of this work to warrant trust in me of any kind, let me be trusted when I tell you that Turner had a heart as intensely kind, and as nobly true, as ever God gave to one of His creatures.¹ I offer, as yet, no evidence in this matter. When I *do* give it, it shall be sifted and clear. Only this one fact I now record joyfully and solemnly, that, having known Turner for ten years, and that during the period of his life when the brightest qualities of his mind were, in many respects, diminished, and when he was suffering most from the evil-speaking of the world, I never heard him say one depreciating word of living man, or man's work;² I never saw him look an unkind or blameful look; I never knew him let pass, without some sorrowful remonstrance, or endeavour at mitigation, a blameful word spoken by another.

Of no man but Turner, whom I have ever known, could I say this. And of this kindness and truth* came, I repeat,

* It may, perhaps, be necessary to explain one or two singular points of Turner's character, not in defence of this statement, but to show its meaning. In speaking of his truth, I use the word in a double sense;—truth to himself, and to others.

Truth to himself, that is to say, the resolution to do his duty by his

¹ [On a loose sheet of MS. is a note on Turner's character perhaps intended for this place:—

“His exquisite tenderness in sight and touch are merely the exponents of his kindness of heart. They are so in all men. The body and mind are always at unity in this; mechanical fineness of execution you may get from a base or hard mind; but tenderness never.”]

² [Among Ruskin's MS. jottings about Turner is the following anecdote contributed by the Rev. W. Kingsley: “On one occasion I made a severe remark on a sunrise by Danby. Turner caught hold of my arm and said, ‘Don't say that: you don't know how such things hurt. You only look at the truth of the landscape; Mr. Danby is a poetical painter.’”]

all his highest power. And all his failure and error, deep and strange, came of his faithlessness.

Faithlessness, or despair, the despair which has been shown already (Vol. III., Chap. xvi. § 31¹) to be characteristic of this present century, and most sorrowfully manifested in its greatest men; but existing in an infinitely

art, and carry all work out as well as it could be done. Other painters, for the most part, modify their work by some reference to public taste, or measure out a certain quantity of it for a certain price, or alter facts to show their power. Turner never did any of these things. The thing the public asked of him he would do, but whatever it was, only as *he* thought it ought to be done. People did not buy his large pictures; he, with avowed discontent, painted small ones; but instead of taking advantage of the smaller size to give, proportionally, less labour, he instantly changed his execution so as to be able to put nearly as much work into his small drawings as into his large ones, though he gave them for half the price. But his aim was always to make the drawing as good as he could, or as the subject deserved, irrespective of price. If he disliked his theme, he painted it slightly, utterly disdainful of the purchaser's complaint. "The purchaser must take his chance." If he liked his theme, he would give three hundred guineas' worth of work for a hundred, and ask no thanks. It is true, exceptionally, that he altered the engravings from his designs, so as to meet the popular taste, but this was because he knew the public could not be got otherwise to look at his art at all. His own drawings the entire body of the nation repudiated and despised: "the engravers could make something of them," they said. Turner scornfully took them at their word. If that is what you like, take it. I will not alter my own noble work one jot for you, but these things you shall have to your minds;—try to use them and get beyond them. Sometimes, when an engraver came with a plate to be touched, he would take a piece of white chalk in his right hand and of black in his left: "Which will you have it done with?" The engraver chose black or white as he thought his plate weak or heavy. Turner threw the other piece of chalk away, and would reconstruct the plate, with the added lights or darks, in ten minutes. Nevertheless, even this concession to false principle, so far as it had influence, was injurious to him: he had better not have scorned the engravings, but either done nothing with them, or done his best. His best, in a certain way, he did, never sparing pains, if he thought the plate worth it; some of his touched proofs are elaborate drawings.

Of his earnestness in his main work, enough, I should think, has been already related in this book; but the following anecdote, which I repeat here from my notes on the Turner Gallery,² that there may be less chance of its being lost, gives, in a few words, and those his own, the spirit of his labour, as it possessed him throughout his life. The anecdote was

¹ [In this edition, Vol. V. p. 336.]

² [See Vol. XIII. pp. 161-162.]

more fatal form in the lower and general mind, reacting upon those who ought to be its teachers.

§ 5. The form which the infidelity of England, especially, has taken, is one hitherto unheard of in human history. No nation ever before declared boldly, by print and word of mouth, that its religion was good for show, but

communicated to me in a letter by Mr. Kingsley, late of Sidney College, Cambridge; whose words I give:—"I had taken my mother and a cousin to see Turner's pictures; and, as my mother knows nothing about art, I was taking her down the gallery to look at the large Richmond Park, but as we were passing the *Snow-storm*, she stopped before it, and I could hardly get her to look at any other picture; and she told me a great deal more about it than I had any notion of, though I have seen many sea-storms. She had been in such a scene on the coast of Holland during the war. When, some time afterwards, I thanked Turner for his permission for her to see the pictures, I told him that he would not guess which had caught my mother's fancy, and then named the picture; and he then said, 'I did not paint it to be understood, but I wished to show what such a scene was like: I got the sailors to lash me to the mast to observe it; I was lashed for four hours, and I did not expect to escape, but I felt bound to record it if I did. But no one had any business to like the picture.' 'But,' said I, 'my mother once went through just such a scene, and it brought it all back to her.' 'Is your mother a painter?' 'No.' 'Then she ought to have been thinking of something else.' These were nearly his words; I observed at the time, he used 'record' and 'painting,' as the title 'author' had struck me before."

He was true to others. No accusation has ever been brought forward against Turner by his most envious enemies, of his breaking a promise, or failing in an undertaken trust. His sense of justice was strangely acute; it was like his sense of balance in colour, and shown continually in little crotchets of arrangement of price, or other advantages, among the buyers of his pictures. For instance, one of my friends had long desired to possess a picture which Turner would not sell. It had been painted with a companion; which was sold, but this reserved. After a considerable number of years had passed, Turner consented to part with it. The price of canvases of its size having, in the meantime, doubled, question arose as to what was then to be its price. "Well," said Turner, "Mr. — had the companion for so much. You must be on the same footing." This was in no desire to do my friend a favour; but in mere instinct of equity. Had the prices of his pictures fallen instead of risen in the meantime, Turner would have said, "Mr. — paid so much; and so must you."¹

But the best proof to which I can refer of this character of his mind

¹ [A more precise version of this incident (or of another like it) supplies a somewhat different, but a touching motive: "Mr. Daniell asked Turner to paint a picture for him, and named 200 guineas as the price which he could afford to give. The commission was accepted and the work was admirably executed, but in

"would not work." Over and over again it has happened that nations have denied their gods, but they denied them bravely. The Greeks in their decline jested at their religion, and frittered it away in flatteries and fine arts; the French refused theirs fiercely, tore down their altars and brake their

is in the wonderful series of diagrams executed by him for his lectures on perspective at the Royal Academy.¹ I had heard it said that these lectures were inefficient. Barely intelligible in expression they might be, but the zealous care with which Turner endeavoured to do his duty, is proved by a series of large drawings, exquisitely tinted, and often completely coloured, all by his own hand, of the most difficult perspective subjects; illustrating not only directions of line, but effects of light, with a care and completion which would put the work of any ordinary teacher to utter shame. In teaching generally, he would neither waste his time nor spare it; he would look over a student's drawing, at the Academy,—point to a defective part, make a scratch on the paper at the side, saying nothing; if the student saw what was wanted, and did it, Turner was delighted, and would go on with him, giving hint after hint; but if the student could not follow, Turner left him. Such experience as I have had in teaching, leads me more and more to perceive that he was right. Explanations are wasted time. A man who can see, understands a touch; a man who cannot, misunderstands an oration.

One of the points in Turner which increased the general falseness of impression respecting him was a curious dislike he had to *appear* kind. Drawing, with one of his best friends,² at the bridge of St. Martin's, the friend got into great difficulty over a coloured sketch. Turner looked over him a little while, then said, in a grumbling way—"I haven't got any paper I like; let me try yours." Receiving a block book, he disappeared for an hour and a half. Returning, he threw the book down, with a growl, saying—"I can't make anything of your paper." There were three sketches on it, in three distinct states of progress, showing the process of colouring from beginning to end, and clearing up every difficulty which his friend had got into. When he gave advice, it was also apt to

the meantime Mr. Daniell had died in the East. For a long time Turner refused all offers for the picture, although they mounted far beyond even twice the sum for which it had been bespoken. No, he said; that was Daniell's picture. I won't part with it. At last, however, he yielded to the urgency of a friend who already possessed a picture of the same size by him; but Turner insisted that the price should be only 200 guineas, because 'that was Daniell's price' (*Quarterly Review*, April 1862, vol. iii. p. 480).]

¹ [On this subject, see Vol. XIII. pp. 307-308 and 307 n.]

² [Munro, of Novar, with whom Turner made a foreign tour in 1836. Munro (who, like Ruskin, had been appointed one of Turner's executors) gave Ruskin, in writing, various particulars of his intercourse with the painter, and of this tour in particular. They went by Dijon to Geneva, Sallanches, Chamouni, and Courmayeur, and thence down the Val d'Aosta to Ivrea and Turin.]

carven images. The question about God with both these nations was still, even in their decline, fairly put, though falsely answered.¹ "Either there is or is not a Supreme Ruler; we consider of it, declare there is not, and proceed accordingly." But we English have put the matter in an

come in the form of a keen question, or a quotation of some one else's opinion, rarely a statement of his own. To the same person producing a sketch, which had no special character: "What are you in search of?" Note this expression. Turner knew that passionate seeking only leads to passionate finding. Sometimes, however, the advice would come with a startling distinctness. A church spire having been left out in a sketch of a town—"Why did you not put that in?" "I hadn't time." "Then you should take a subject more suited to your capacity."

Many people would have gone away considering this an insult, whereas it was only a sudden flash from Turner's earnest requirement of wholeness or perfectness of conception. "Whatever you do, large or small, do it wholly; take a slight subject if you will, but don't leave things out." But the principal reason for Turner's having got the reputation of always refusing advice was, that artists came to him in a state of mind in which he knew they could not receive it. Virtually, the entire conviction of the artists of his time respecting him was, that he had got a secret, which he could tell if he liked, that would make them all Turners. They came to him with this general formula of request clearly in their hearts, if not definitely on their lips: "You know, Mr. Turner, we are all of us quite as clever as you are, and could do all that very well, and we should really like to do a little of it occasionally, only we haven't quite your trick; there's something in it, of course, which you only found out by accident, and it is very ill-natured and unkind of you not to tell us how the thing is done;—what do you rub your colours over with, and where ought we to put in the black patches?" This was the practical meaning of the artistical questioning of his day, to which Turner very resolutely made no answer. On the contrary, he took great care that any tricks of execution he actually did use should not be known.

His *practical* answer to their questioning being as follows:—"You are indeed, many of you, as clever as I am; but this, which you think a secret, is only the result of sincerity and toil. If you have not sense enough to see this without asking me, you have not sense enough to believe me, if I tell you. True, I know some odd methods of colouring. I have found them out for myself, and they suit me. They would not suit you. They would do you no real good; and it would do me much harm to have you mimicking my ways of work, without knowledge of their meaning. If you want methods fit for you, find them out for yourselves. If you cannot discover them, neither could you use them."

¹ [Compare the author's introduction to *Crown of Wild Olive*.]

entirely new light: "There *is* a Supreme Ruler, no question of it, only He cannot rule. His orders won't work. He will be quite satisfied with euphonious and respectful repetition of them. Execution would be too dangerous under existing circumstances, which He certainly never contemplated."

I had no conception of the absolute darkness which has covered the national mind in this respect, until I began to come into collision with persons engaged in the study of economical and political questions. The entire naïveté and undisturbed imbecility with which I found them declare that the laws of the Devil were the only practicable ones, and that the laws of God were merely a form of poetical language, passed all that I had ever before heard or read of mortal infidelity. I knew the fool had often said in his heart, there was *no* God;¹ but to hear him say clearly out with his lips, "There is a foolish God," was something which my art studies had not prepared me for. The French had indeed, for a considerable time, hinted much of the meaning in the delicate and compassionate blasphemy of their phrase "*le bon Dieu*," but had never ventured to put it into more precise terms.

§ 6. Now this form of unbelief in God is connected with, and necessarily productive of, a precisely equal unbelief in man.

Co-relative with the assertion, "There is a foolish God," is the assertion, "There is a brutish man." "As no laws but those of the Devil are practicable in the world, so no impulses but those of the brute" (says the modern political economist) "are appealable to in the world. Faith, generosity, honesty, zeal, and self-sacrifice are poetical phrases. None of these things can, in reality, be counted upon; there is no truth in man which can be used as a moving or productive power. All motive force in him is essentially brutish, covetous, or contentious. His power is only power

¹ [Psalms xiv. 1, often quoted by Ruskin: see, for instance, Vol. X. pp. 67, 379; Vol. XI. p. 120.]

of prey: otherwise than the spider, he cannot design; otherwise than the tiger, he cannot feed." This is the modern interpretation of that embarrassing article of the Creed "the communion of saints."

§ 7. It has always seemed very strange to me, not indeed that this creed should have been adopted, it being the entirely necessary consequence of the previous fundamental article;—but that no one should ever seem to have any misgivings about it;—that, practically, no one had *seen* how strong work *was* done by man; how either for hire, or for hatred, it never had been done; and that no amount of pay had ever made a good soldier, a good teacher, a good artist, or a good workman.¹ You pay your soldiers and sailors so many pence a day, at which rated sum, one will do good fighting for you; another, bad fighting. Pay as you will, the entire goodness of the fighting depends, always, on its being done for nothing; or rather, less than nothing, in the expectation of no pay but death.² Examine the work of your spiritual teachers, and you will find the statistical law respecting them is, "The less pay, the better work." Examine also your writers and artists: for ten pounds you shall have a *Paradise Lost*,³ and for a plate of figs, a Dürer drawing;⁴ but for a million of money sterling, neither. Examine your men of science: paid by starvation, Kepler⁵ will discover the laws of the orbs of heaven for you;—and,

¹ [Compare *A Joy for Ever*, § 98 (Vol. XVI. p. 83).]

² [Compare *Unto this Last*, §§ 17, 21.]

³ ["Fair day's-wages for fair day's-work! exclaims a sarcastic man. Alas, in what corner of this Planet, since Adam first awoke on it, was that ever realised? The day's-wages of John Milton's day's-work, named *Paradise Lost* and *Milton's Works*, were Ten Pounds paid by instalments, and a rather close escape from death on the gallows" (Carlyle: *Past and Present*, book i. ch. iii.).]

⁴ [Compare *Queen of the Air*, § 135, where Ruskin says of Dürer that he "would sometimes estimate a piece of his unconquerable work at only the worth of a plate of fruit, or a flask of wine—would have taken even one 'fig for it,' kindly offered." The reference is to Dürer's diary (mentioned by Ruskin in Vol. XII. p. 247 *n.*), of his journey in the Netherlands, in which the artist records many gifts of his works in exchange for kindness or hospitality shown to him; sometimes for a dinner or a present of wine.]

⁵ [For the instance of Kepler, see *Fors Clavigera*, Letter 4, where Ruskin quotes from Carlyle's *Friedrich*.]

driven out to die in the street, Swammerdam¹ shall discover the laws of life for you:—such hard terms do they make with you, these brutish men, who can only be had for hire.

§ 8. Neither is good work ever done for hatred, any more than hire;—but for love only. For love of their country, or their leader, or their duty, men fight steadily; but for massacre and plunder, feebly. Your signal, “England expects every man to do his duty,” they will answer; your signal of Black flag and death’s-head, they will not answer. And verily they will answer it no more in commerce than in battle. The cross-bones will not make a good shop-sign, you will find ultimately, any more than a good battle-standard. Not the cross-bones, but the cross.

§ 9. Now the practical result of this infidelity in man is the utter ignorance of all the ways of getting his right work out of him. From a given quantity of human power and intellect, to produce the least possible result, is a problem solved, nearly with mathematical precision, by the present methods of the nation’s economical procedure. The power and intellect are enormous. With the best soldiers, at present existing, we survive in battle, and but survive, because, by help of Providence, a man whom we have kept all his life in command of a company forces his way at the age of seventy so far up as to obtain permission to save us, and die, unthanked.² With the shrewdest thinkers in the world, we have not yet succeeded in arriving at any national conviction respecting the uses of life. And with the best artistical material in the world, we spend millions of money in raising a building for our Houses of Talk,³ of the delightfulness and utility of which (perhaps roughly classing the Talk and its tabernacle together,) posterity will,

¹ [See Michelet’s *L’Insecte*, book ii. ch. i., “Swammerdam”—a book already referred to above, pp. 232, 333 n.]

² [Ruskin writes here in the margin of his copy “General Havelock.”]

³ [For Ruskin’s dislike of the Houses of Parliament, see Vol. IV. p. 307 n.; Vol. VIII. p. 147 n.; and Vol. XII. p. 478. In the first draft of this passage, he wrote here:—

“ . . . a building for our Houses of Talk, which will so long as it stands be the most perfect type of vain and dull foolishness existing in architecture.”]

I believe, form no very grateful estimate;—while for sheer want of bread, we brought the question to the balance of a hair, whether the most earnest of our young painters should give up his art altogether, and go to Australia,—or fight his way through all neglect and obloquy to the painting of the Christ in the Temple.¹

§ 10. The marketing was indeed done in this case, as in all others, on the usual terms. For the millions of money, we got a mouldering toy: for the starvation, five years' work of the prime of a noble life. Yet neither that picture, great as it is, nor any other of Hunt's, are the best he could have done. They are the least he could have done. By no expedient could we have repressed him more than he has been repressed; by no abnegation received from him less than we have received.

My dear friend and teacher, Lowell, right as he is in almost everything, is for once wrong in these lines, though with a noble wrongness:—

“Disappointment's dry and bitter root,
Envy's harsh berries, and the choking pool
Of the world's scorn, are the right mother-milk
To the tough hearts that pioneer their kind.”²

They are *not* so; love and trust are the only mother-milk of any man's soul. So far as he is hated and mistrusted, his powers are destroyed. Do not think that with impunity you can follow the eyeless fool, and shout with

¹ [It was in 1851 that Holman Hunt, almost at the end of his resources, “announced to Millais my intention to give up art altogether, and to go for a twelve-month to a good yeoman uncle for instruction as a farmer, and at the end of the time to emigrate to Canada or to the Antipodes to take my place as a settler.” Millais made him a loan, and he was thus enabled to paint “The Light of the World.” Then came his journey to the East, and at Jerusalem Hunt commenced his “Finding of the Saviour in the Temple.” “For four years after my return to England,” he says, “I had to keep it, often with its face to the wall, while I was working at pot-boilers, to get the means to advance it at all” (“The Pre-Raphaelite Brotherhood: a Fight for Art,” *Contemporary Review*, May and June 1886, pp. 748, 831). The picture was completed and exhibited in the year in which Ruskin was here writing (1860).]

² [From the poem entitled “Columbus.” For another expression of Ruskin's indebtedness to Lowell, see above, p. 372 n.]

the shouting charlatan; and that the men you thrust aside with gibe and blow, are thus sneered and crushed into the best service they can do you. I have told you they *will* not serve you for pay. They *cannot* serve you for scorn. Even from Balaam, money-lover though he be, no useful prophecy is to be had for silver or gold.¹ From Elisha, saviour of life though he be, no saving of life—even of children's, who "know no better,"—is to be got by the cry, Go up, thou bald-head. No man can serve you either for purse or curse; neither kind of pay will answer. No *pay* is, indeed, receivable by any true man; but *power* is receivable by him, in the love and faith you give him. So far only as you give him these can he serve you; that is the meaning of the question which his Master asks always, "Believest thou that I am able?" And from every one of his servants—to the end of time—if you give them the Capernaum measure of faith, you shall have from them Capernaum measure of works, and no more.

Do you think that I am irreverently comparing great and small things? The system of the world is entirely one; small things and great are alike part of one mighty whole. As the flower is gnawed by frost, so every human heart is gnawed by faithlessness. And as surely,—as irrevocably,—as the fruit-bud falls before the east wind, so fails the *power* of the kindest human heart, if you meet it with poison.²

§ 11. Now the condition of mind in which Turner did all his great work was simply this: "What I do must be done rightly; but I know also that no man now living in Europe cares to understand it; and the better I do it, the less he will see the meaning of it." There never was yet, so far as I can hear or read, isolation of a great spirit so utterly desolate. Columbus had succeeded in making other

¹ [On "the avarice of Balaam" (who was "hired," Deuteronomy xxiii. 4), see Vol. IV. p. 214. For the other Biblical references in § 10, see 2 Kings ii. 23; Matthew ix. 28; viii. 5, 10, 13.]

² [Compare *A Joy for Ever*, § 23 (Vol. XVI. p. 31).]

hearts share his hope, before he was put to hardest trial; and knew that, by help of Heaven, he could finally show that he was right. Kepler and Galileo could demonstrate their conclusions up to a certain point; so far as they felt they were right, they were sure that after death their work would be acknowledged. But Turner could demonstrate nothing of what he had done;—saw no security that after death he would be understood more than he had been in life. Only another Turner could apprehend Turner. Such praise as he received was poor and superficial: he regarded it far less than censure. My own admiration of him was wild in enthusiasm, but it gave him no ray of pleasure; he could not make me at that time understand his main meanings;¹ he loved me, but cared nothing for what I said, and was always trying to hinder me from writing, because it gave pain to his fellow-artists. To the praise of other persons he gave not even the acknowledgment of this sad affection; it passed by him as murmur of the wind: and most justly, for not one of his own special powers was ever perceived by the world. I have said in another place that all great modern artists will own their obligation to him as a guide.² They will; but they are in error in this gratitude, as I was, when I quoted it as a sign of their respect. Close analysis of the portions of modern art founded on Turner has since shown me that in every case his imitators misunderstood him:—that they caught merely at superficial brilliancies, and never saw the real character of his mind or of his work.³

¹ [See above, p. 435 n.; and with the following passage here, compare Turner's tacit disapproval of the publication of Ruskin's answer to *Blackwood* in his defence, Vol. I. p. xviii.]

² [See *Lectures on Architecture and Painting*, § 99 (Vol. XII. p. 127); and for later statements to the same effect, *Queen of the Air*, § 177, and *Lectures on Landscape*, § 20.]

³ [In the MS. the following footnote is here appended:—

“Turner can only be comprehended in any way by persons who have drawn for years in pure light and shade without colour; and with the pencil or pen point—not the brush. Without this discipline—prolonged and stern—no touch of Turner's can ever be perceived in its true power.”

On such discipline, see Vol. XIII. pp. 239 *seq.*]

And at this day, while I write, the catalogue allowed to be sold at the gates of the National Gallery, for the instruction of the common people, describes Callcott and Claude as the greater artists.¹

§ 12. To censure, on the other hand, Turner was acutely sensitive, owing to his own natural kindness; he felt it, for himself, or for others, not as criticism, but as cruelty. He knew that however little his higher power could be seen, he had at least done as much as ought to have saved him from wanton insult; and the attacks upon him in his later years were to him not merely contemptible in their ignorance, but amazing in their ingratitude. "A man may be weak in his age," he said to me once, at the time when he felt he was dying; "but you should not tell him so."²

§ 13. What Turner might have done for us, had he received help and love, instead of disdain, I can hardly trust myself to imagine. Increasing calmly in power and loveliness, his work would have formed one mighty series of poems, each great as that which I have interpreted,—the

¹ [This is the unofficial catalogue referred to in Vol. XIII. p. 102 n. In the MS. of the chapter Ruskin says, "I bought it at the door of the Gallery on the day I began this chapter, in order to see how far general public instruction on the subject of Turner's art had advanced," and he gives the extract in question:—

"479. The Sun rising in a Mist, fishing-boats arriving and unloading, fishermen cleaning and selling fish; guardship in the distance; tide low Turner.

"This is not a favourable specimen of Turner's talent, taste, or genius. The smoky atmosphere over sky and water is heavy and dull with a dirty brown general tone unsuited to the silvery haze of morning: it is neither still nor fresh, but heavy. The ships and boats are perhaps the best of the picture, but even they are deficient in cool reflections, and partake of the rusty, general tone. The group of fishermen and women is tolerably interesting, but the flat fish lying about are like *large dabs* or spots of white without arrangement or meaning. How differently did Callcott paint these scenes of Morning mist on coast or fisherman's hut! How superior are some of Claude's quiet, aerial, evanescent representations of early morn!"

For Ruskin's references to Callcott, see, amongst other passages in the first volume of *Modern Painters*, Vol. III. pp. 191, 266, 324, 598.]

² [This was probably said in reference to the ridicule cast upon his picture (1842) of Napoleon ("The Exile and the Rock Limpet": see Vol. XIII. p. 161 and n.).]

Hesperides; but becoming brighter and kinder as he advanced to happy age. Soft as Correggio's, solemn as Titian's, the enchanted colour would have glowed, imperishable and pure; and the subtle thoughts risen into loftiest teaching, helpful for centuries to come.

What we have asked from him, instead of this, and what received, we know. But few of us yet know how true an image those darkening wrecks of radiance give to the shadow which gained sway at last over his once pure and noble soul.

§ 14. Not unresisted, nor touching the heart's core, nor any of the old kindness and truth: yet festering work of the worm—inexplicable and terrible, such as England, by her goodly gardening, leaves to infect her earth-flowers.

So far as in it lay, this century has caused every one of its great men, whose hearts were kindest, and whose spirits most perceptive of the work of God, to die without hope:—Scott, Keats, Byron, Shelley, Turner. Great England, of the Iron-heart now, not of the Lion-heart; for these souls of her children an account may perhaps be one day required of her.¹

§ 15. She has not yet read often enough that old story of the Samaritan's mercy.² He whom he saved was going down from Jerusalem to Jericho—to the accursed city (so the old Church used to understand it). He should not have left Jerusalem; it was his own fault that he went out into the desert, and fell among the thieves, and was left for dead. Every one of these English children, in their day, took the desert by-path as he did, and fell among fiends—took to making bread out of stones at their bidding, and then died, torn and famished; careful England, in her pure, priestly dress, passing by on the other side. So far as

¹ [See Luke xi. 49, 50: "I will send them prophets and apostles, and some of them they shall slay and persecute: that the blood of all the prophets . . . may be required of this generation."]

² [Luke x. 30–37.]

³ [See Joshua vi. 26.]

we are concerned, that is the account *we* have to give of them.*

§ 16. So far as *they* are concerned, I do not fear for them;—there being one Priest Who never passes by. The longer I live, the more clearly I see how all souls are in His hand—the mean and the great. Fallen on the earth in their baseness, or fading as the mist of morning in their goodness;—still in the hand of the potter as the clay, and in the temple of their master as the cloud. It was not the mere bodily death that He conquered—that death had no sting. It was this spiritual death which He conquered, so that at last it should be swallowed up—mark the word—not in life; but in victory. As the dead body shall be raised to life, so also the defeated soul to victory, if only it has been fighting on its Master's side, has made no covenant with death; nor itself bowed its forehead for his seal. Blind from the prison-house, maimed from the battle, or mad from the tombs, their souls shall surely yet sit, astonished, at His feet Who giveth peace.¹

§ 17. Who *giveth* peace? Many a peace we have made and named for ourselves, but the falsest is in that marvellous thought that we, of all generations of the earth, only know the right; and that to us at last,—to us alone,—all the scheme of God, about the salvation of men, has been shown. “This is the light in which *we* are walking. Those

* It is strange that the last words Turner ever attached to a picture should have been these:—

“The priest held the poisoned cup.”

Compare the words of 1798 with these of 1850.²

¹ [For the Biblical references in § 16, see Hebrews vii. (Jesus as Priest); Jeremiah xviii. 6 (“as the clay is in the potter's hand”) and Romans ix. 21; 1 Corinthians xv. 55, 54; John xiv. 27.]

² [The reference is to “The Departure of the (Trojan) Fleet,” exhibited in 1850, with these lines in the catalogue:—

“The Orient moon shone on the departed fleet,
Nemesis invoked, the priest held the poisoned cup.”

—*MS. Fallacies of Hope.*

The picture (No. 554 in the National Gallery Collection) has been removed to Manchester. For “the words of 1798,” see above, p. 390.]

vain Greeks are gone down to their Persephone for ever—Egypt and Assyria, Elam and her multitude,—uncircumcised, their graves are round about them—Pathros and careless Ethiopia—filled with the slain. Rome, with her thirsty sword, and poison wine, how did she walk in her darkness! We only have no idolatries—ours are the seeing eyes; in our pure hands at last, the seven-sealed book is laid; to our true tongues entrusted the preaching of a perfect gospel. Who shall come after us? Is it not Peace? The poor Jew, Zimri, who slew his master, there is no peace for him:¹ but, for us? tiara on head, may we not look out of the windows of heaven?"

§ 18. Another kind of peace I look for than this, though I hear it said of me that I am hopeless.

I am not hopeless, though my hope may be as Veronese's: the dark-veiled.²

Veiled, not because sorrowful, but because blind. I do not know what my England desires, or how long she will choose to do as she is doing now;—with her right hand casting away the souls of men, and with her left the gifts of God.

In the prayers which she dictates to her children, she tells them to fight against the world, the flesh, and the devil.³ Some day, perhaps, it may also occur to her as desirable to tell those children what she means by this. What is the world which they are to "fight with," and how does it differ from the world which they are to "get on in"? The explanation seems to me the more needful, because I do not, in the book we profess to live by, find anything very distinct about fighting with the world. I find something about fighting with the rulers of its darkness, and something also about overcoming it; but it does not follow that this

¹ [2 Kings ix. 31. For the other Biblical references in § 17, see Acts ii. 9, etc. (Elamites); Isaiah xi. 11 ("the remnant" of the Lord's people "from Pathros and from Elam"; Isaiah xx. 3, etc. (Ethiopia); Isaiah ix. 2 ("walked in darkness"); Revelation v. 1, 2; Genesis vii. 11.]

² [See above, p. 291.]

³ [See the Collect for the 18th Sunday after Trinity.]

conquest is to be by hostility, since evil may be overcome with good. But I find it written very distinctly that God loved the world, and that Christ is the light of it.¹

§ 19. What the much-used words, therefore, mean, I cannot tell.² But this, I believe, they *should* mean. That there is, indeed, one world which is full of care, and desire, and hatred: a world of war, of which Christ is not the light, which indeed is without light, and has never heard the great "Let there be."³ Which is, therefore, in truth, as yet no world; but chaos, on the face of which, moving, the Spirit of God yet causes men to hope that a world will come. The better one, they call it: perhaps they might, more wisely, call it the real one. Also, I hear them speak continually of going to it, rather than of its coming to them;⁴ which, again, is strange, for in that prayer which they had straight from the lips of the Light of the world, and which He apparently thought sufficient prayer for them, there is not anything about going to another world; only something of another government coming into this; or rather, not another, but the only government,—that government which will constitute it a world indeed. New heavens and new earth. Earth, no more without form and void, but sown with fruit of righteousness. Firmament, no more of passing cloud, but of cloud risen out of the crystal sea—cloud in which, as He was once received up, so He shall again come with power, and every eye shall see Him, and all kindreds of the earth shall wail because of Him.

Kindreds of the earth, or tribes of it!* the "earth⁵-begotten," the Chaos children—children of this present

* Compare Matt. xxiv. 30.

⁴ [Compare *Crown of Wild Olive*, § 40.]

⁵ [A description (*χαμαιγενής*, or *γηνερής*) commonly applied by the Greeks to the generations of men.]

[illegible]

world, with its desolate seas and its Medusa clouds: the Dragon children, merciless: they who dealt as clouds without water: serpent clouds, by whose sight men were turned into stone;—the time must surely come for their wailing.

§ 20. "Thy kingdom come." we are bid to ask then! But how shall it come? With power and great glory, it is written; and yet not with observation, it is also written.¹ Strange kingdom! Yet its strangeness is renewed to us with every dawn.

When the time comes for us to wake out of the world's sleep, why should it be otherwise than out of the dreams of the night? Singing of birds, first, broken and low, as, not to dying eyes, but eyes that wake to life, "the casement slowly grows a glimmering square";² and then the gray, and then the rose of dawn; and last the light, whose going forth is to the ends of heaven.

This kingdom it is not in our power to bring; but it is, to receive. Nay, it is come already, in part; but not received, because men love chaos best; and the Night, with her daughters. That is still the only question for us, as in the old Elias days, "If ye will receive it." With pains it may be shut out still from many a dark place of cruelty; by sloth it may be still unseen for many a glorious hour. But the pain of shutting it out must grow greater and greater:—harder, every day, that struggle of man with man in the abyss, and shorter wages for the fiend's work. But it is still at our choice; the simoom-dragon may still be served if we will, in the fiery desert, or else God walking in the garden, at cool of day. Coolness now, not of Hesperus over Atlas, stooped endurer of toil; but of Heosphorus³

¹ [Matthew xxiv. 30 and Luke xvii. 20. For the other Biblical references in § 20, see Psalms xix. 6; Matthew xi. 14; Genesis iii. 8; Matthew iv. 8; Matthew xviii. 1-4; xix. 30; 1 Corinthians xv. 26; Job xvii. 14; Revelation ii. 23; Matthew xii. 50.]

² [Tennyson: *The Princess*, iv.]

³ [Not of the Evening Star over Atlas, sustaining the heavens on his shoulder, in the fiery desert (pt. ix. ch. x. § 4), but of the Morning Star over "the joy of the whole earth, Mount Zion." For *Ἑωσφορος*, see *Iliad*, xxiii. 226.]

over Sion, the joy of the earth.* The choice is no vague nor doubtful one. High on the desert mountain, full descried, sits throned the tempter, with his old promise—the kingdoms of this world, and the glory of them. He still calls you to your labour, as Christ to your rest;—labour and sorrow, base desire, and cruel hope. So far as you desire to possess, rather than to give; so far as you look for power to command, instead of to bless; so far as your own prosperity seems to you to issue out of contest or rivalry, of any kind, with other men, or other nations; so long as the hope before you is for supremacy instead of love; and your desire is to be greatest, instead of least;—first, instead of last;—so long you are serving the Lord of all that is last, and least;—the last enemy that shall be destroyed—Death; and you shall have death's crown, with the worm coiled in it; and death's wages, with the worm feeding on them; kindred of the earth shall you yourself become; saying to the grave, "Thou art my father"; and to the worm, "Thou art my mother, and my sister."

I leave you to judge, and to choose, between this labour, and the bequeathed peace; these wages, and the gift of the Morning Star; this obedience, and the doing of the will which shall enable you to claim another kindred than of the earth, and to hear another voice than that of the grave, saying, "My brother, and sister, and mother."

* Ps. xlviii. 2.—This joy it is to receive and to give, because its officers (governors of its acts) are to be Peace, and its exactors (governors of its dealings), Righteousness (Is. lx. 17).

EPILOGUE

(1888)

THE republication of this book may seem to break faith with persons who have bought the old editions at advanced prices, trusting my announced resolution that no other should be issued during my lifetime.¹ Had I remained in active health, none could have been; for I should have employed the engravers otherwise (especially Mr. Allen himself); but I have permitted the re-issue of this early work, to be of what use it may, finding that my plans of better things in the same direction must be abandoned. For the rest, I never encourage the purchase, at advanced prices, of books which their authors wish to withdraw from circulation; and finally, I believe the early editions will never lose their value in the book-market, the original impressions of the plates by Mr. Armytage and Mr. Cousen being entirely beyond imitation by restored plates. Mr. Allen's advertisements are trustworthy as to the cost and pains which have been given to bring the steels up to their first standard, and the adequacy of the impressions obtained to answer the general purposes of the first engraving.² But no retouched plate is ever really worth the original one.

¹ [On this subject, see the Introduction to the first volume of *Modern Painters* (Vol. III. pp. xlvii., l.), and the author's Preface to the edition of 1873 (*ibid.*, p. 54).]

² [Mr. Allen's circular, announcing "A New and Complete Edition of Mr. Ruskin's 'Modern Painters'" was issued in January 1888. With regard to the Plates it stated: "In five volumes, with all the 87 illustrations, besides three hitherto unpublished ('The Lake of Zug,' 'Dawn after the Wreck,' and 'Château de Blois'), etched by Mr. Ruskin and mezzotinted by the late Thomas Lupton, previously intended for the fifth volume. Three of the nine Plates that were destroyed have been carefully reproduced from early proofs of those originally etched by the author's own hand, and the others re-engraved by the best engravers. Of the remainder, all are in good state, and the results obtained by careful printing are such as to justify the publisher's expectations as to the success of the work from an artistic point of view; the larger margins of this edition also making the Plates more effective."]

Although, as I have said, the book would not have been reprinted if I had been able to write a better to the same effect, I am glad, as matters stand, that the chapters in which I first eagerly and passionately said what throughout life I have been trying more earnestly and resolutely to say, should be put within the reach of readers who care to refer to them.

For the divisions of religious tenet and school to which I attached mistaken importance in my youth, do not in the least affect the vital teaching and purpose of this book: the claim, namely, of the Personal relation of God to man as the source of all human, as distinguished from brutal, virtue and art. The assertion of this Personal character of God must be carefully and clearly distinguished by every reader who wishes to understand either *Modern Painters* or any of my more cautiously written subsequent books, from the statement of any Christian doctrine, as commonly accepted. I am always under the necessity of numbering with exactness, and frequently I can explain with sympathy, the articles of the Christian creed as it has been held by the various painters or writers of whose work I have to speak. But the religious faith on which my own art teaching is based never has been farther defined, nor have I wished to define it farther, than in the sentence beginning the theoretical part of *Modern Painters*:¹—

“Man’s use and purpose—and let the reader who will not grant me this, follow me no farther, for this I purpose always to assume—is to be the witness of the glory of God, and to advance that glory by his reasonable obedience and resultant happiness.”

Nothing is here said of any tradition of Fall, or of any scheme of Redemption; nothing of Eternal Punishment, nothing of Immortal Life. It is assumed only that man can love and obey a living Spirit; and can be happy in the presence and guidance of a Personal Deity, otherwise than a mollusc, a beetle, or a baboon.

¹ [In the second volume : see in this edition Vol. IV. p. 28.]

But I will ask the reflective reader to note besides, that it is said to be the use of man to advance God's glory "by his obedience and happiness,"—not by lectures on the Divine wisdom, meant only to show his own. By his obedience, "reasonable," in submission to the Greater Being because He *is* the greater; not because we are as wise as He, and vouchsafe to approve His methods of creation. By our happiness, following on that obedience; not by any happiness snatched or filched out of disobedience; lighting our lives with lightning instead of sunshine—or blackening them with smoke in the day, instead of receiving God's night in its holiness.

Then, lastly, after the crowning of obedience, and fulfilment of joy, comes the joy of praise,—the "I will magnify Thee, O God my *King*" of the hundred and forty-fifth Psalm;¹—the "My soul doth magnify the Lord, and my spirit hath rejoiced in God my *Saviour*," of the Magnificat;—the "Bless ye the Lord" of the three Holy Children;—the "We praise thee, O Lord" of the Archangels with all the Host of Heaven;—and in the hearts of all, the deepest joy still in the Madonna's thought, for He hath regarded—the lowliness—of His handmaiden,—of His Archangel, or of His first-praying child;—and perfected praise on the lips of the Babe, as on the harp of David.

He hath regarded their *lowliness*. But not—their *vileness*! The horror and shame of the false Evangelical Religion is in its recommending its souls to God, not for their humility, but their sin! Not because they cast their crowns before God's throne, but because they strew His earth with their ashes.

All that is involved in these passionate utterances of my youth was first expanded and then concentrated into the aphorism given twenty years afterwards in my inaugural Oxford lectures, "All great Art is Praise";² and on that

¹ [For the references here, see Luke ii. 46; the *Benedicite* (or "The Song of the Three Holy Children"); and Revelation iv. 10.]

² [Not in his inaugural *Lectures on Art* (1870), but in the heading and opening words of *The Laws of Fésale* (Vol. XV. p. 351). The following quotation is from the *Lectures on Art*, § 95.]

aphorism, the yet bolder saying founded, "So far from Art's being immoral, in the ultimate power of it, nothing but Art is moral: Life without Industry is sin, and Industry without Art, brutality" (I forget the words, but that is their purport): and now, in writing beneath the cloudless peace of the snows of Chamouni, what must be the really final words of the book which their beauty inspired and their strength guided, I am able, with yet happier and calmer heart than ever heretofore, to enforce its simplest assurance of Faith, that the knowledge of what is beautiful leads on, and is the first step, to the knowledge of the things which are lovely and of good report; and that the laws, the life, and the joy of beauty in the material world of God, are as eternal and sacred parts of His creation as, in the world of spirits, virtue; and in the world of angels, praise.

CHAMOUNI,

Sunday, September 16th, 1888.

PORTION OF THE VOLUME

IV. NOTES ON GERMAN GALLERIES (1859)

A LECTURE ON "TREE TWIGS"¹

(Delivered at the Royal Institution, April 19, 1861)

1. THE lecturers that usually appeared in the place he occupied that evening were the greatest philosophers of the age, and the deepest truths and the latest discoveries of science were the engrossing topics on which they dwelt. But no such high interest attached to what he had to say on this occasion. All he should endeavour to do would be to point out the connection between the laws of nature and those of art, the aspects of nature and the aspects of art. He had only elementary truths to tell—he could hardly say to teach, as they were already known, although perhaps sometimes forgotten.

By little twigs the most important fabric on the face of the earth was woven. Of iron and many other substances so useful to our race, so abundant in nature, we see nothing of the elaborations; but of trees, timber, wood, we see the workmanship daily carried on before us. The flowers of the field neither toil nor spin, but the leaves of the forest are ceaseless toilers; all their existence long they are spinners, and weavers, and miners; and the timber of our largest trees displays the warp and woof of the multiple threads which the ever-working leaves have elaborated.

2. There are three modes of aggregation: (1) simple, like the shingle on our seashores; (2) tree-growth, in which one layer of material is laid over the other, with a bond of union between the two; and (3) perfect growth, as in animals, in which the organ has always the same form, but increases

¹ [For some remarks on this lecture, see above, Introduction, p. lix. The following report, with woodcuts illustrating it, first appeared in the *London Review*, April 27, 1861. It was reprinted in *Lydrasil*, December 1891, vol. iii. pp. 172-176, but without the illustrations, a few consequential alterations being made in the text, and thence was similarly reprinted in the privately-issued *Ruskiniana*, Part ii., 1892, pp. 193-196. The illustrations 1-4 and 7-15 were given, roughly, in the *London Review*; they have been recut for this edition from the large illustrations which Ruskin prepared for his lecture, and which are preserved at Brantwood. The paragraphs are here numbered for convenience of reference. The report commenced with the following introductory sentences: "The eminence of Mr. Ruskin as an art-critic, and the excellence and popularity of his published works, of course secured for him, at the Royal Institution, a most brilliant audience. His subject was apparently a simple one, *Tree Twigs*, but the numerous artistic diagrams with which it was illustrated at once showed how fertile of art lessons it would prove."]

in size—as, for example, the hand, which, although it grows larger, is nevertheless always a hand.

The growth of a tree commences with a short stem, to which another stem is vertically added, and so on a third; but the rod which this vertical

Fig. 1

Fig. 2

Fig. 3

Fig. 4

elongation would ultimately make would be too slender, too weak, for any covering of leaves. Against this result nature provides by sending down constantly two roots for every shoot sent up, so that every branch and trunk is thus encased and strengthened.

3. The next inquiry which naturally arises is as to the structure of these shoots.

In the dicotyledonous trees, which are the most interesting to us as being of native growth, these twigs are divided into two classes—namely, those of a square form (Fig. 1), and those which are pentagonal (Fig. 2), or have many sides. In the former, the shoots are alternately placed at right angles to each other (Fig. 3); in the latter, they form by their positions a spiral round the stem (Fig. 4). The position of the leaves is not, however, strictly geometrical, each leaf trying, as it were, to get the most room and air for itself in seeking the most open space. There is something like instinct or volition in this; and one can but consider this power of choosing the best condition to be dependent on the vital energy. The five upper leaves of the oak exhibit this beautiful spiral arrangement. The horse-chestnut exhibits even more beautifully than any other tree this arrangement; for the alternate leaves, although crowded, grow with the most perfect grace and freedom [Figs. 5 and 6].

4. Of one school of art it was scornfully said that its artists followed out the minutiae of their pictures with microscopic exactness; but before the microscope was known, and in all ages, there had been a class of painters who had given the utmost attention to the perfection of details. It was to be remarked, that, whenever leafage had been carefully studied and finished, that school, whether in painting or architecture, had always flourished; whenever the leaves were neglected, that school had failed.¹ The Venetian pictures held the first place in art; and how wonderful was their finish in this respect! The portrait of Ariosto, by Titian,² in the National Gallery, was referred to for its foliage background. The events transpiring in Italy might give the chance to our nation of obtaining some of the best examples, and nothing advanced the art student so much as seeing and studying the work of a really great painter. What has advanced sculpture in our land so much as the fine examples of Greek art, and especially the Elgin marbles? One good Venetian picture in our national collection would be a school of art established for ever.

5. Figure 7 is given as a type of the work of the leaf left, after it falls, in a polygonal tree—namely, the oak. That left in a rectangular tree would present a similar appearance, except only that the buds would be in pairs instead of single. Each of these types is connected with those of monocotyledonous trees by intermediate conditions, such as those of the *arbor vitæ* and pine. Figures 8 and 9 represent the outer spray of the *arbor vitæ*, which is broad in one direction, narrow in another, and forms gradually a branch, which is flat in its foliage, though the stem is rounded by the gradual accretion of the decaying leaves. This tree may be considered as forming the link between the rectangular dicotyledons and the monocotyledons; while the pine, in which the leaves, arranged in a spiral order, leave, when they fall a spray, such as Fig. 10, is the link between the alternate dicotyledon and the monocotyledon. Such being the general

¹ [Compare pt. vi. ch. v. § 4 (p. 53).]

² [The reference is to No. 636, formerly so ascribed; for many years called "Portrait of a Poet, by Palma Vecchio," but now (1905) re-attributed to Titian. The picture had been acquired in 1860. Ruskin's political reference is to the disturbed state of the new Italian kingdom.]

structure of the sprays, we have next to consider the mode of ramification. Each healthy shoot every year adds at least four others to its extremity, two and two (Fig. 11), in opposite vertical planes if the character of the

Fig. 5

stem be square; three, in separate divergent directions (Fig. 12), if it be polygonal. Thus, the minimum increase can be stated at three shoots for each extremity of every stem. Each of these twigs again, at the next season of growth, produces three others (Fig. 13), and so on at every ensuing

increase. These twigs are thus constantly massing themselves towards the outer circumference of the tree (Fig. 14), while the stouter branches which support them are comparatively inert and lifeless.

6. Careless painters were apt to represent them by a series of irregular offshoots, and as dying away in their energy towards their tips (Fig. 15) Such might be true of the twig, in which the vital energy was most forcibly

Fig. 6

put forward in its first sprouting; but it was not so in the bough, at the extremity of which the numerous new subdivisions or twigs formed themselves into a globular interlacing mass, in which the fullest vitality of the tree was exhibited.

That, observe, is considering the bough only as a flat ramification; but actually, as the shoots in a rectangular tree spring into the form of a cross, and in a polygonal tree in a spiral order, the ramification being on all sides

with equal force, the resulting structure takes a cup shape, so that every tree may be considered as a mass terminated by a spherical or round surface, composed of a series of cup-shaped masses of foliage, emerging one from within the other.

7. There is a general tendency in the boughs of some trees to curve

Fig. 7

Fig. 8

Fig. 9

Fig. 10

with a concave outwards; in other trees the concave is inwards. If the concave is outwards, the aspect of the tree is like that of a fountain, throwing its branches out from the central stem; if the concave is inwards, it more resembles a fir-cone, the successive cups closing round each other towards the top of the tree. Every branch, in carrying on the formation of the mass of its leaves, to occupy in successive years the place which

they are required to fill in the typical form of the tree, exercises an instinct like that of an animal. It is commonly said that light and heat operate on vegetable tissue under fixed mechanical laws; but there is a vital law which modifies the action of the light and heat, which accepts that action willingly if it draws the bough where the bough wants to go, which refuses; and painfully submits to the same action if it drives or attracts the bough where it does not want to go.

8. Hence there is a continual exhibition of vital power and of instinctive choice of place and of direction, contending with adverse mechanical influences, or flourishing under favourable ones; and the curvatures of a bough are therefore sometimes free, sometimes cramped, sometimes suddenly

Fig. 11

Fig. 12

Fig. 15

Fig. 13

Fig. 14

changed, sometimes resolutely consistent in purpose. These characters give at once grace, fantasy, and yet the look of imperfect organic life which distinguished the beauty of a branch from that of any other flexible form. In the convolutions of a serpent, for instance, the whole body is animated at once by a harmonious force; in the undulations of a wave, governed by a force communicated under constant laws. The line of a branch, interrupted in vitality and subjected to various accidents, stiffly graceful and fitfully consistent, is recognisable at a glance from all other conditions of consecutive lines presented in the natural world.

9. In bringing out these results, it will be seen that the action of the leaf differs wholly from that of the flower. The flower perishes quickly, leaving behind it the seed which is to be developed into its successor. The leaf not only leaves behind it the bud which is to be developed into a similar shoot, but works all its life long in order to establish the succeeding shoot under different circumstances from all that had preceded it. It

not only leaves the bud, but places it and provides for it by the actual substance of the stem from which it is to advance to greater height and wider range. The main function of the flower, therefore, is accomplished only in its death; that of the leaf depends on prolonged work during its life.

10. This difference in the operation of the flower and leaf has attracted the attention of all great nations, as a type of the various conditions of the life of man. Chaucer's poem of "The Flower and the Leaf," in which the

Fig. 16

strongest knights and noblest ladies worship the goddess of the leaf in preference to the goddess of the flower, is perhaps the clearest expression of the feeling of the Middle Ages in this respect. That of the Greeks is set forth by the fable of the Rape of Proserpine. The Greeks had no goddess Flora correspondent to the Flora of the Romans. The Greek Flora is Persephone, the "bringer of death," because they saw that the force and use of the flower was only in its death. For a few hours Proserpine plays in the Sicilian fields; but, snatched away by Pluto, her destiny is accomplished in the Shades, and she is crowned in the grave.¹ The Greek

¹ [Compare *Queen of the Air*, § 11.]

feeling respecting the leaf is set forth by the fable of Apollo and Daphne.¹ Daphne is the daughter of one of the great mountain rivers of Arcadia and of the Earth; that is to say, she is the mist of the dashing river filing the mountain valley. The sun chasing the mist from chasm to chasm is Apollo pursuing Daphne. Where the mist is sheltered by the rocks from the heat of the sun, the laurel and other richest vegetation spring in profusion; and thus the laurel-leaf becomes the type of the animating power of the rivers and of the sunshine, and therefore the reward and crown of all vigorous human work nourished at once by the dew of earth and the light of heaven.

11. This interpretation of the fable of Apollo and Daphne might at first be doubted, but will not be so when it is compared with the original eastern tradition as preserved in the book of Genesis. In the garden of Paradise we are not told that there were flowers. We may conjecture that the term "herb of the field" includes them, but we are told positively that there grew every tree—literally every timber—good for food and pleasant to the eyes. And it is said that these trees were not watered by rain, for rain had not been caused upon the earth. The brightness of the sky was not to be concealed by rain-clouds, but a mist rose from the ground to water the garden.² Sunshine and mist together forming the nourishment of its vitality, as in Arcadia, the Eden of the Greeks, the same power is attributed to Apollo and Daphne.

12. In applying these principles to art, the same feeling appeared to animate the best workmen of the great times. The noblest architectural decorations had been found in the leaf rather than in the flower: in the Acanthus by the Greeks, and in nearly every form of Spring vegetation by the Gothic workmen.³ The merit of the work might be almost always judged of by the simplicity of line and by the artist's dwelling on the spring and growth of individual leaves rather than on the shadows produced by their entanglement. The intricate shadows of complex foliage or flowers formed the decorations of declining architecture; but in the best times the designs consisted of few lines, like those of the example here given (Fig. 16), from the Ducal Palace of Venice, in which there was no palpable dexterity of cutting, but an exquisite attention to and enjoyment of the spring of the stem and the undulation of the foil. All good work was, then, grave, intense, and attentive, not necessarily minute. It might be thought that the details into which the lecturer had entered descended into too accurate particulars, but the distinction between accuracy and minuteness was just that on which depended the distinction between true and false art. It was quite possible to be accurate without being small; small without being accurate. The scale on which work is done depends upon place and convenience, but no work was ever done well which was not founded on the loving and attentive examination of every natural fact which came within its range.

¹ [Compare Ruskin's note on Turner's picture of "Apollo and Daphne," Vol. XIII. p. 149.]

² [Genesis ii. 5, 6.]

³ [Here compare *Stones of Venice*, vol. i., on the acanthus as the root of all leaf ornament (Vol. IX. p. 279); and vol. ii. and vol. iii., on the superiority of the simple to the more florid style (Vol. X. p. 432, Vol. XI. p. 9).]

ABSTRACT OF THE SAME LECTURE BY RUSKIN¹

THE speaker's purpose was to exhibit the development of the common forms of branch, in dicotyledonous trees, from the fixed type of the annual shoot. Three principal modes of increase and growth might be distinguished in all accumulative change, namely:—

1. Simple aggregation, having no periodical or otherwise defined limit, and subject only to laws of cohesion and crystallisation, as in inorganic matter.

2. Addition of similar parts to each other, under some law fixing their limits and securing their unity.

3. Enlargement, or systematic change in arrangement, of a typical form, as in the growth of the members of an animal.

The growth of trees came under the second of these heads. A tree did not increase in stem or boughs as the wrist and hand of a child increased to the wrist and hand of a man; but it was built up by additions of similar parts, as a city is increased by the building of new rows of houses.

Any annual shoot was most conveniently to be considered as a single rod, which would always grow vertically if possible.

Every such rod or pillar was, in common timber trees, typically either polygonal in section, or rectangular.

If polygonal, the leaves were arranged on it in a spiral order, as in the elm or oak.

If rectangular, the leaves were arranged on it in pairs, set alternately at right angles to each other.

Intermediate forms connected each of these types with those of monocotyledonous trees. The structure of the *arbor vitæ* might be considered as typically representing the link between the rectangular structure and that of monocotyledons; and that of the pine between the polygonal structure and that of monocotyledons.

Every leaf during its vitality secreting carbon from the atmosphere, with the elements of water, formed a certain quantity of woody tissue, which extended down the outside of the tree to the ground, and farther to the extremities of the roots. The mode in which this descending masonry was added appeared to depend on the peculiar functions of cambium, and (the speaker believed) was as yet unexplained by botanists.

Every leaf, besides forming this masonry all down the tree, protected a bud at the base of its own stalk. From this bud, unless rendered abortive, a new shoot would spring next year. Now, supposing that out of the leaf-buds on each shoot of a pentagonal tree, only five at its extremity or on its

¹ [This is the abstract drawn up by Ruskin. It was issued as a leaflet at the time of the lecture, and reprinted in the *Proceedings of the Royal Institution*, vol. iii. pp. 358–360, where the abstract is headed thus: “Weekly Evening Meeting, Friday, April 19, 1861. Sir Roderick I. Murchison, D.C.L., F.R.S., Vice-President, in the Chair. John Ruskin, Esq., *On Tree Twigs*.” The abstract was reprinted in *On the Old Road*, 1885, vol. i. pp. 717–720 (§§ 575–580), and again in the second edition of that work, vol. ii. pp. 354–358 (§§ 284–289).]

side were permitted to develop themselves, even under this limitation the number of shoots developed from a single one in the seventh year would be 78,125. The external form of a healthily grown tree at any period of its development was therefore composed of a mass of sprays, whose vitality was approximately distributed over the *surface* of the tree to an equal depth. The branches beneath at once supported, and were fed by, this orbicular field, or animated external garment of vegetation, from every several leaf of which, as from an innumerable multitude of small green fountains, the streams of woody fibre descended, met, and united as rivers do, and gathered their full flood into the strength of the stem.

The principal errors which had been committed by artists in drawing trees had arisen from their regarding the bough as ramifying irregularly, and somewhat losing in energy towards the extremity; whereas the real boughs threw their whole energy, and multiplied their substance, towards the extremities, ranking themselves in more or less cup-shaped tiers round the trunk, and forming a compact united surface at the exterior of the tree.

In the course of arrival at this form, the bough, throughout its whole length, shewed itself to be influenced by a force like that of an animal's instinct. Its minor curves and angles were all subjected to one strong ruling tendency and law of advance, dependent partly on the aim of every shoot to raise itself upright, partly on the necessity which each was under to yield due place to the neighbouring leaves, and obtain for itself as much light and air as possible. It had indeed been ascertained that vegetable tissue was liable to contractions and expansion (under fixed mechanical conditions) by light, heat, moisture, etc. But vegetable tissue in the living branch did not contract nor expand under external influence alone. The principle of life manifested itself either by contention with, or felicitous recognition of, external force. It accepted with a visible, active, and apparently joyful concurrence, the influences which led the bough towards its due place in the economy of the tree; and it obeyed reluctantly, partially, and with distorted curvatures, those which forced it to violate the typical organic form. The attention of painters of foliage had seldom been drawn with sufficient accuracy to the lines either of branch curvature, or leaf contour, as expressing these subtle laws of incipient volition; but the relative merit of the great schools of figure design might, in absence of all other evidence, be determined, almost without error, by observing the precision of their treatment of leaf curvature. The leaf-painting round the head of Ariosto by Titian, in the National Gallery, might be instanced.

The leaf thus differed from the flower in forming and protecting behind it, not only the bud in which was the form of a new shoot like itself, but a piece of permanent work, and produced substance, by which every following shoot could be placed under different circumstances from its predecessor. Every leaf laboured to solidify this substance during its own life; but the seed left by the flower matured only as the flower perished.

This difference in the action and endurance of the flower and leaf had been applied by nearly all great nations as a type of the variously active and productive states of life among individuals or commonwealths. Chaucer's poem of the "Flower and Leaf" is the most definite expression of the mediæval feeling in this respect, while the fables of the rape of Proserpine

and of Apollo and Daphne embody that of the Greeks. There is no Greek goddess corresponding to the Flora of the Romans. Their Flora is Persephone, "the bringer of death." She plays for a little while in the Sicilian fields, gathering flowers, then snatched away by Pluto, receives her chief power as she vanishes from our sight, and is crowned in the grave. Daphne, on the other hand, is the daughter of one of the great Arcadian river gods, and of the earth; she is the type of the river mist filling the rocky vales of Arcadia; the sun, pursuing this mist from dell to dell, is Apollo pursuing Daphne; where the mist is protected from his rays by the rock shadows, the laurel and other richest vegetation spring by the river-sides, so that the laurel-leaf becomes the type, in the Greek mind, of the beneficent ministry and vitality of the rivers and the earth, under the beams of sunshine; and therefore it is chosen to form the signet-crown of highest honour for gods or men, honour for work born of the strength and dew of the earth and informed by the central light of heaven; work living, perennial, and beneficent.

II

ADDITIONAL PASSAGES FROM THE MS. OF "MODERN PAINTERS," VOL. V.

1. CHARACTER IN TREES

[AMONG the loose sheets in the Pierpont Morgan MSS (see above, p. lxiii.) there is a fragment headed "Vegetation," which deals, in a very suggestive way, with an aspect of the matter not touched upon in the text—namely, the character which may be given by an inventive painter to his trees, so as to enhance the harmony of a composition:—]

"This is not so with all the other accessories of a picture even by the greatest masters; very often a piece of architecture, or furniture, or drapery is introduced merely for the sake of its lines (the *impennata* and the *sediola* are of no dramatic value whatever to the two *madonnas* to which they give names), but a good painter never introduces a passionless tree.

"Look back to Plate 11 (vol. iii.).¹ The foliage there is in entire sympathy with the quiet ecclesiastical landscape—everything walled, spired, peaceful, and precise, but full of light. The trees grow in untroubled straightness as they need no strength of bough, the *madonna's* presence rendering storms impossible; with lispings leaves they express their timid reverence for her; sweet original trees, their leaves not yet expanded, nay, they will never expand them, lest they should cast anything like shadow on the sunny fields.

"Take up and compare directly with this Plate Turner's 'Hedging and Ditching'² of the *Liber Studiorum*—the expression of steady commonplace-character in a bitter world. Some capacities of grace about the poor things once, had they been left to themselves or pruned wisely; some remnants of it even yet, where they rise against the sky at the bend of open road, for the most part hacked and blighted and cropped or withered away, hardly knowing whether they still are trees or only firewood. There is no tragedy allowed them neither, no pity to be had from anybody; they never can have had polite people to look at them. Advisable agricultural operations going

¹ [In this edition, Vol. V. p. 394.]

² [For another reference to this Plate, see above, p. 433.]

on, bleak wind, angry clouds and vulgar people, penned, uncomfortable sheep—such life must they still bud and blossom for as best may be.

“Next take up the Château of the Belle Gabrielle¹ in order to see what courtly and sweet creatures trees may be when they have fair ladies to be companions to them. Not by any means straight of growth nor ecclesiastical in order now, in no wise saintly trees nor precise, but infinitely graceful and softly wayward, taking their pleasure in the tender air—sharp-leaved, if need be, across the light—as wit gives brightness to passion: may the autumn be long in coming, the river still pass by with stormless stream.

“Now the Raglan²—Liber Studiorum—wild wood of old baronial park, it and its towers gone to ruin together; the old walls rounded with ivy, the wood roots choked with undergrowth and the brook with its sedges, but noble yet in reverential neglect and in honoured solitude; no axe lifted up on stone or stem; dim legends of fairy ladies and grey-bearded knights keeping the cotters’ children away at the sunset; the water-lilies gleaming ungathered; the wild-fowl has heard our feet though we trod quietly, and it flutters, startled, across the stream with a wake of light.

“Now the Procris and Cephalus³—divine trees of dark and pensive power, their leaves closed together in a cloud of night; beneath them, avenues where the nymphs and wood-gods wander.”

[Here the fragment ends.]

2. COMPOSITION

[It has been remarked above, in the Introduction (p. lxiii.), that the section in this volume on “Invention Formal,” or pictorial composition, is on a less elaborate scale than that of other sections in the work. One reason for this is stated at the beginning of the author’s first draft of Part viii. ch. i. :—]

“I do not propose to enter in this work at any length on the examination of technical composition. The most interesting examples of it are to be found among the great figure painters.”

[But to enter upon an analysis of such examples would have been to travel somewhat far from the main scope of the work, which was mainly concerned with Landscape Painting. The author remarks, however, elsewhere in the draft MS., that he would “be able to illustrate all known laws of composition even from the few works of Turner engraved in this book.” The reason why he did not enter upon such a detailed examination is probably, as suggested above (p. lxiii.), that he had already gone over much of the ground in *The Elements of Drawing*. But he seems at one

¹ [Compare Vol. III. p. 239.]

² [See above, p. 434.]

³ [See again, p. 434.]

time to have intended to bring the analysis of composition in that work into relation with the general argument of *Modern Painters*. For elsewhere in the draft we read:—]

“I have already stated that this technical composition is in the type of the providential government of the world: as it is universally delightful to the human mind, and essential as a part of a great picture.”

[Ruskin did not, however, continue this passage; but on the back of a sheet of the MS. there is this conspectus of the subject:—]

Infinity	{ Curvature. Continuity.
Unity	{ Principality. Radiation.
Symmetry	{ Contrast. Interchange.
Purity	{ Consistency Harmony.
Repose	Repetition.

[In the first column Ruskin enumerates, it will be seen, the Ideas of Typical Beauty, which he had analysed in the second volume of *Modern Painters* (part iii. sec. i. chapters v.–ix.). In the second, he enumerates the Laws of Composition, which he had analysed in *The Elements of Drawing* (§§ 188–239, Vol. XV. pp. 161–205).]

3. “IDEAS OF RELATION: MAGNITUDE, OR NUMBER”

[The following fragment is contained in a small blue copy-book, written by some amanuensis, and is described by Ruskin (in his later handwriting) on the cover as “Part of unpublished old *Modern Painters*—very valuable.”]

“Chiefly impressive when showing us our own weakness or littleness. Mountains wonderful chiefly so long as we cannot climb or understand them.

“Of these, then, the first, or most palpable, is the right expression of the power of gravitation; or rather of the submission of things to that power in the degree expressive of their nature. Of course, if a painter draws one kind of line rightly, he will draw all kinds rightly; but of the various orders of line I believe those resulting from gravitation are peculiarly impressive to great men, and are perhaps dwelt upon with greater awe and affection than any others. So that one of the best mechanical tests one can apply in a rough way to an artist’s

work, to know the stamp of the man, is to look whether the gravitating curves are true and frequent. And it appears to me natural that the perception of lines of gravitation should indicate the mind of a good painter, since, well considered, this gravitation is indeed the most awful of all material laws; and, in so far as it seems universal, affecting all kinds of matter alike * it is the most visibly supernatural of all forces, because it does not attach itself to the nature of the things. The properties which make one substance explosive, another soluble, another tenacious, belong to them like a part of their nature; but gravity is a strange, invisible, external force, applied to them all equally.

"In some trains of thought we might be led to consider this force as typical of the general tendency to decline or destruction in all things resisted by their vital energies—the idea of ascent being to us usually connected with life and power; of descent, with death and feebleness. The lines expressing gravitation may thus become awful to us, because they are the signs of a fate, or fatal power, which nothing can for an instance elude, and which can be resisted only by the force either of inner life or of some external aid, failing which, everything is equally subjected to it, and at any instant it falls 'come corpo morto cade.'¹

"I imagine that, so far as our daily and common sensations are concerned, this is the real root of the nobleness of lines of gravitation; but a more extended view of this great force, removing the notions of high and low, or of fall and ascent, must show it us as a force, not of destruction, but of assemblage—the force by which literally 'all things consist,'² and opposing itself in accurate balance to the great separating force of radiation, by which all things distribute their atoms or operations to each other. Thus the sun is kept in his place and course by gravitation, and enlightens the earth by radiation. Both forces are beneficent, and the lines which express them are therefore noble; but those of radiation, which express life, excite in us chiefly the sensation of beauty; those of gravitation, which express stability or death, excite in us chiefly the sensation of the sublime.

"The just drawing of the lines of gravitation extends its influence to almost every object, just as the force itself does; and the power of drawing them rightly is seen in its greatest perfection when the gravitation is combined with many other forces, and influences complicated structures. One of the principal sources of Vandyck's great power in drawing hands is his always giving with exquisite precision the amount of curve produced by dead weight in the fingers and arm. Lay your arm at this moment on the edge of the table, or on the back of your chair, and let your hand hang down without the slightest effort. Turning it loosely up and down several times, letting it always fall back into its place so as to be sure you are not using any muscular effort to sustain it, you will find that, according to the position of your arm, form of the table's edge, etc., the hand takes a certain degree of drooping

* Note on imponderability—heat is not matter.

¹ [*Inferno*, v. 142.]

² [See above, p. 206.]

inclination, which is quite fixed for each position of the arm and fingers. The precise observation and drawing of this true droop give grace and sublimity to the painting of the hand; but the slightest slope less or more than its gravity requires will destroy both, and only the greatest painters can catch the true line.

"The same law of curve holds good not for hands only but for every part of the human body. Whatever action it may be in, whatever form of support may be supposed for it, whether it is poised on wings, springing by its own muscular strength, or laid at rest, supported on any given group of points or extent of surfaces, still its own gravity has a definite influence on every part of it; and the points of support and mode of action being once determined, the lines which rightly express the weight of the body must be determined also. On the seizing them accurately depends the expression of buoyancy in flying, of strength and grace in leaping or dancing, of repose in resting; no mathematical laws are fall enough to determine the true lines, nor are any mathematical tests subtle enough to detect violations of the true lines. But the errors are not indefinite, though they are undemonstrable; rightness and wrongness are just as absolute as in drawing a common form in perspective, or out of it, only we can briefly demonstrate the error in one case, and the demonstration is too long and too complicated to be possible in the other. But the great painters recognise the lines by pure instinct, and invariably seize them; and mean painters just as assuredly lose them, and that not only in drawing from nature, but even in copying. The first thing a bad copyist does invariably, is to lose the balance and sway of all his figures, no matter how carefully he may have drawn them to scale; no scales nor measurements will save him; every one of his lines will go wrong in spite of them; his flying figures will look as if they were falling; his falling figures as if they were falling; whatever he tries to make firm, will immediately totter; and whatever his wish that anything should be tremulous, will instantly make it rigid. It is, however, necessary in treating this subject to consider separately the taste which chooses positions of repose for the figures, and the power of representing the repose so chosen. For not only does Vandyck differ from a common portrait painter in being able to draw the true line of a recumbent hand, but in choosing the position of recumbence rather than one of rigid extension or quick movement. Nevertheless, though these two merits must be separate in our thinking of them, they are never separate in the painter. Every painter who can see and draw the lines of repose accurately, delights also in positions of repose, so that to say a painter draws truly, will always imply also that his figures are full of quietness or quietnesses.

"No matter how energetic their action, there will be strange rests and reserves mingled with it, while the bad painter will make it all spatter and explosion. And therefore, as I stated truly in the chapter on repose, in the second volume, this look of quietness is a sure test of good work; whenever people can draw rightly, they draw quietly, and draw quiet things, and the quiet is in proportion to the rightness. The flying figures of Tintoret or Veronese look as if they could pause in the

air like eagles; but the flying figures of inferior painters fly like tom-tits—all flutter. The sleeping figures of Tintoret or Veronese sleep as if the earth stood still underneath them, and the air softened itself to lull them; but the sleeping figures of bad painters look as if they had shut their eyes to cheat us, and were hearing all that was going on. The leaping figures of Tintoret or Veronese leap like panthers, so that you shall not hear them touch the ground; but the leaping figures of inferior painters leap like grasshoppers—all rustle and jerk."

4. WATER BEAUTY

[It has been explained above (p. lviii.) that Ruskin omitted one intended section of this volume—namely, on Beauty of Water. No material for this section has been found either in the MS. drafts of the volume or among the author's loose MSS. But in his diary of 1856 there is the following conspectus of the subject, as he meant to treat it:—]

"1st. *Calm Water*.—Typical character of the law of reflection, giving a kind of symmetry to everything: the modes of change between real and reflected images most beautiful. Kingsley's cows.¹ Lago Maggiore: the reflection of *under* side of awning is the principal mass, and that of the boat is full dark green, a small bar of clear transparent green appearing at the prow as the thrust of the oar raises a wave there. This is where the boat is coming to you—strait foreshortened. Beauty of its mystified and blended colours—Highland lochs where colour very lovely.

"Cuyt, brown only; Claude, nothing; Salvator, nothing; Poussin, nothing.

"Mirage. Mystery of water, still less. Turner's lake in Daphne² especially.

"Surface and curves. Floating and poise of boats—Lione, etc. Examine curves of Turner's bays: perhaps give Plate. Winding rivers. Mystery of shore form in my Loire, etc.³ Get some Salvator shores to oppose.

"2nd. *Rough Water*.—Sea. My Land's End bit.⁴ Turner's curves as opposed Vandevelde's. Sea power never expressed before. Insist on sublime divinity. His wrecks.⁵

¹ [A drawing of cows by Turner in the possession of Ruskin's friend, the Rev. W. Kingsley, for whom see Vol. XIII. p. 162 n. It is not clear to what drawing Ruskin refers as "Lago Maggiore."]

² [For this picture (No. 520 in the National Gallery), see Vol. XIII. p. 148.]

³ [The series of drawings of the Loire given by Ruskin to Oxford.]

⁴ [The passage in *Modern Painters*, vol. i. (Vol. III. p. 566).]

⁵ [The following is an entry from the same diary:—

"Dover, September 26.—Heavy storm all day: doing nothing but walk about beach before and after lunch. Ascertained Turner's singular veracity in the way the waves threw up the pieces of timber they had torn away from the Admiralty Pier—beams twelve feet long and two feet thick thrown

“3rd. *Running Water*.—Never attempted at all before him. Bolton.¹
Fountain, water in vignette.

“All I have to say of boats must be done with ‘Of the Calm Water’; and all of wrecks with ‘The Sea.’”

continually *vertical* at the edge of the breakers, tossed up like straws, and pieces of wood flung about like hail. A pier three feet long and half a foot thick *said* to have been thrown right over the Lord Warden Hotel.”]

¹ [The drawing, often referred to in *Modern Painters* and partly engraved as “The Shores of Wharfe” (see Plate 12 in Vol. V. and Plate 12A in Vol. VI.). The “Fountain, water in vignette” refers presumably to the frontispiece to Rogers’s *Poems*, known as “The Garden”; the drawing for it is No. 220 in the National Gallery; for another reference to it see Vol. III. pp. 306-307.]

III

THE AUTHOR'S PROPOSED RE-ARRANGEMENT OF A PORTION OF THE VOLUME

[RUSKIN, as he says in a letter of 1874,¹ had at one time an intention of recasting the artistic criticisms of *Modern Painters*, omitting some of the religious discussions on which he had come to take a different standpoint. In a copy of the book, which he afterwards presented to Arthur Burgess (now in the possession of Mr. Hugh Allen), he has made excisions and rearrangements which seem to belong to a proposed revision of parts viii. and ix. ("Of Ideas of Relation"). This rearrangement would have more emphasised "Ideas of Power," a side of the matter which, as he said at Oxford,² he had not sufficiently emphasised. It will be observed, in the text as it stands, that Ideas of Power are involved in the discussion of Ideas of Relation; for he defines the latter as an inquiry "into the various *Powers*, Conditions, and Aims of mind involved in the conception or creation of pictures" (pt. viii. ch. i. § 1, p. 203).

In recasting this portion of his work Ruskin strikes out lines 7 and 8 of the existing text, thus keeping part viii. more strictly to technical matters. He then notes "Bring in first Ch. ii. of Vol. IV."

It thus appears that chapter i., after a brief exposition of the remaining scope of the work (pt. viii. ch. i. § 1), would have consisted of that chapter in the fourth volume ("Of Turnerian Topography"), which certainly belongs more properly to the now proposed place, its subject-matter being the question "how far the artist should permit himself to alter, or, in the usual art language, improve nature" (Vol. VI. p. 27).

Then chapter ii. would have been the present chapter i. of part viii. ("The Law of Help"). Here, again, in his proposed rearrangement Ruskin made excisions with a view of keeping more closely to the matter immediately in hand. Thus he strikes out from § 5 the passage "Life and consistency . . . creatures of the earth" (p. 206); he breaks off in § 13 at "*ποίησις*,

¹ [Vol. III. p. xlix.]

² [*Lectures on Art*, §§ 74, 100.]

otherwise, poetry," omitting all that follows down to line 2 of § 20, the passage thus reading:—

"Invention is pre-eminently the deed of human creation; *ποίησις*. otherwise, poetry. For a poet, or creator, is a person who puts things together . . ." (p. 215).

Chapter iii. in the rearrangement is the present chapter ii. ("The Task of the Least"), down to the end of the first paragraphs in § 14 ("separated from all common work by an impassable gulf"). At that point, in the text as it stands, Ruskin notes in his copy, "Now to p. 245 *Elements of Drawing*" (i.e., to the page beginning the discussion of Composition in that work). "adding p. 184 here" (i.e., p. 236 in this edition).

The Principles of Composition, enumerated and discussed in *The Elements of Drawing*, would presumably have formed a separate chapter in the proposed rearrangement, followed, as part of it, by the present chapter iv. ("The Law of Perfectness," or of Reserve); this, as the markings in his copy show, Ruskin intended to shorten. (Here, compare Appendix II. 2, above p. 481.)

Next, in another chapter would have come the present chapter iii. To this, in his copy, Ruskin wrote the following introductory remarks:—

"There is, however, another and a nobler phase of the ideas of power, dependent on the actual vastness of subject and command taken of it by the painter. Of this I have not said enough, but the following passages bear upon it."

Part viii. "Of Invention Formal" (or Composition) would thus have been arranged as follows:—

Chapter i. "Of Turnerian Topography"; or, of the permissible limits of the alteration of nature (now chapter ii. of vol. iv.).

Chapter ii. "The Law of Help"; or, the first principle of Composition, viz. the help of everything in the picture by everything else (now chapter i. of part viii.).

Chapter iii. "The Task of the Least"; or, the methods by which every minutest part may thus be made helpful, the "Law of Perfectness" being added to the other laws analysed in *Elements of Drawing* (now chapter ii. of part viii.; *Elements of Drawing*, §§ 188–239; and §§ 1–6 of chapter iv. here).

Chapter iv. "The Rule of the Greatest"; or, the command taken by an inventive painter of a vast subject.

Ruskin continued, in the same copy of the volume, to revise part ix. ("Of Invention Spiritual"). Here there was no rearrangement, but some cutting down. Thus in chapter i. he struck out §§ 10–15 (except the last paragraph), and in chapter ii. the first eight lines of § 1; but the revision of this part did not proceed far enough (it stops altogether after chapter iv.) to give any complete idea of Ruskin's scheme.]

IV

NOTES ON GERMAN GALLERIES

(1859)

[RUSKIN'S illustrative references to pictures in the present volume were largely taken from the German Galleries which he studied in 1859 (see the Introduction, above, pp. l.-liv.). The following are notes from his diary:—]

AIX-LA-CHAPELLE

ALFRED RETHEL'S *Frescoes in Hôtel de Ville*, full of power but wholly valueless, as well as Cornelius's windows, from trying to be fine. All strained in treatment and ghastly—not, which is curious, very energetic in action. Charlemagne seizing a standard, quite feeble.¹

COLOGNE²

OVERBECK'S *Virgin in the chapel of Cathedral*,³ with Abraham and David below, execrable beyond all contempt. The lower part feebly and basely borrowed from Titian's Apotheosis of Philip IV.⁴ Abraham holding up his knife as Noah holds up the ark, and David holding down his harp in the same way as Titian's David; the plagiarism of course being cunningly concealed by alterations, as real base plagiarism is always;—spoiling whatever it touches; while noble plagiarism is as open and frank as the day, and ennobles whatever it touches.⁵ The white, goggle-eyed, paste-faced Virgin, monstrous and ridiculous beyond description.

BENDEMANN'S *By the Waters of Babylon*, the engraved picture, vile, distorted, dead, despicable stuff—one base mass of affectation, ignorance, and want of feeling. Grey, or buff, wretched heavy paint

¹ [For Rethel, see Vol. XII. p. 489. The stained-glass windows by Cornelius (1783-1867) are in the choir of the Cathedral; for other references to Overbeck, see Vol. XV. p. 157.]

² [For notes from this same diary on pictures by Rubens at Brussels and Cologne, see above, p. 329.]

³ [Over the altar in the Chapel of the Virgin.]

⁴ [So in the diary; but "Apotheosis of Philip IV." must be a mistake. For Titian's "David," in the Salute at Venice, see Vol. XI. p. 429 n.]

⁵ [On the subject of plagiarism, see Vol. V. p. 427.]

—inconceivably clumsy and coarse in drawing—a violet-coloured distance of streaky impossible architecture—no words are strong enough to speak its impotent baseness in its endeavour to be fine.¹

This last picture is in the miserable old Museum—catalogue-less, a squeaking old woman, yet well-mannered and good-natured, telling the names of pictures.²

William of Cologne, and Stephen of Cologne, have some good qualities; the other religious painters are powerless.

A picture of the fourteenth century in tempera—consisting of many compartments under gilded niches, but nearly destroyed by the candles of the altar, and cracking all away in unnoticed neglect, on the left of the chapel to the extreme east of the cathedral choir—contains the only truly and lovely work I have seen in the town. An Annunciation, a Salutation, a Flight into Egypt, and a Virgin and St. Joseph washing the little Christ in a tub of water, out of which he lifts his hands in an appealing manner, are all exquisite.³

In Cornelius's fresco⁴ Achilles is going up a step with a stride at full length of legs, frowning like a boy of fifteen acting Hamlet, drawing his sword; Minerva on the wing catches his hair; the degradation and wooden beastliness of the whole is unspeakable.

BERLIN⁵

RAUCH's *Frederick the Great*.⁶ Far too high to be seen even by my keen eyes. One sees nothing but soles of boots, cross handle of stick swinging from his wrist, and irregular ragged cloak which destroys the conception of his figure, as it really must have been, wholly. His Apotheosis—he sitting as on a sofa, on the back of an eagle, between its wings, the eagle holding its claws in a pitiful contracted way, like a dog begging, with a painful expression of beak. He holds a palm in one hand! some stars sprinkled about. Not the smallest strength or power of flight in the bird, or understanding of the way an eagle flies—Frederick the Great turned into an ornament for a French drawing-room in ormolu! The whole is set, with exquisite ludicrousness of chance, at the back of the monument, so that if you look the least above the Apotheosis, you have a full view of the horse's posteriors, and if it were alive, there is no saying what might

¹ [Edward Bendemann, born at Berlin 1811, died at Düsseldorf 1889.]

² [A catalogue was compiled a few years after Ruskin's visit.]

³ [These are the paintings on the wings of the Altar of St. Clara, in the Chapel of St. John; ascribed to William of Cologne (died 1378).]

⁴ [At Munich, in the Glyptothek.]

⁵ [Other pictures in the Berlin Gallery noticed by Ruskin are Titian's "Lavinia" (see above, p. 117), and a landscape by Rubens (above, p. 411 n.). For a general remark on the Gallery (which has been greatly developed since 1859), see above, Introduction, p. lii.]

⁶ [At the east end of the Linden; a work in bronze erected in 1851. The full height of the statue is, inclusive of the pedestal, somewhat over forty-two feet from the ground. One of the bas-relief tablets which flank the pedestal represents the Apotheosis of the monarch. Ruskin referred to this work, as also to the monument of Queen Louise, in a letter to the *Scotsman* of June 15, 1859; reprinted in *Arrows of the Chace*, 1880, vol. ii. pp. 17, 18, and in a later volume of this edition.]

not happen at any moment to Frederick the Great in Apotheosis. The four equestrian figures of the angles, each horse lifting one of its forelegs, symmetrically at each course, are among the most pitifully uninventive and vulgar pieces of work I have ever seen. Kant has a very disagreeable face. He is talking to Lessing, as if trying to prove something—his hand up. Lessing has his hands folded, and listens apparently in an attentive contempt. In a bit of bas-relief behind, a laurel or palm—or some such thing, I forget what—touches Lessing's head—I should think to mark his superiority.

*The Monument to the Queen Louisa*¹ (Charlottenburg) could not, to be tolerably good work, be less pathetic. She has her limbs crossed not gracefully; too little drapery altogether, like a sheet sticking to a person who has rolled about restlessly all night. The head thoroughly German; and a German head, with its thickish end of nose, and its eyes shut, is not beautiful.

There is not one ray of genius nor any peculiar or striking degree of even superficial gift in Rauch. It is entirely commonplace work, and second-rate commonplace.

Queen Louisa's monument, seen by blue light, like scene in *Robert le Diable*, Doric pillars outside, A ~~R~~ W all the inscription—but much German inside—of tolerably well-chosen texts. Avenue of pines leading up to it is good.

HOLBEIN.—*Portrait of George Gyzen*. Black overcoat, white shirt seen at throat, red undercoat showing itself at sleeves. Woodwork behind of vivid green. A ball of golden and blue enamel suspended in the upper corner, absolutely definite in drawing of pattern, as firm in outline as his ink drawing, yet by pure gradation and tremulousness of exquisite painting made to look as round and tender and lovely as if it were Titian's work. The pinks in glass, the glass itself, and the paper on table quite ineffable in perspective. The face I think not quite so fine. The hair also is too much drawn hair by hair, but a wonderful piece of work. Note that his seal ring, lying on the table, has the arms on it in colour. They are too mysteriously and exquisitely painted to be made out; three yellow flowers of this shape—size [sketch]—in vase with pinks; they come on the red sleeve; the red pinks on the black.²

DRESDEN

BACKGROUNDS OF TITIAN.—1. RED LADY.³ All grey. An octagonal table, with carved foot *dimly* painted, for her hand to rest on. Darks of dress and hair all dark on ground.

¹ [Louisa, Queen of Prussia, born 1776 (daughter of Duke Charles of Mecklenburg-Strelitz); married, 1793, the Crown Prince, afterwards King Frederick William III. of Prussia; died 1810. The monument is by Christian Daniel Rauch (1777-1857).]

² [This famous portrait is described by Ruskin in his paper on "Sir Joshua and Holbein," reprinted in a later volume of this edition.]

³ [No. 1. "Red Lady" is the "Portrait of a Lady in a Red Dress" (No. 176 in the present numbering of the Gallery): see above, Preface, § 4, p. 6. Elsewhere

2. WHITE FAN. All brown, very dark, *no object*. A dim light cast conventionally relieves the dark of hair and line of neck dark against it down to the shoulder knot, where all again is light on the ground.
3. LAVINIA. Dark grey on left, so dark as to throw out the lights of the dark green dress in strong light relief. A grey wall behind on the right is lighter; it has no object, but the name Lavinia and something more on it. It throws out the line of the neck, the hair, and waist in dark upon it, while Lavinia's own shadow cast on it throws her sleeve again into light.
4. A dark woman in black, of which I have engraving; all brown.
5. Woman with vase, cleaned to pieces, greenish-grey, no object, some trick of light as in white fan.

VERONESE.—The four great ones,¹ and three smaller ones—namely, (1) Supper at Emmaus; (2) Finding of Moses; (3) Centurion beseeching for his Servant.

1. First idea of that in the Louvre, the same child, a vine arcade on the left in plain brown, wonderfully laid in. Expression much better in figures than in larger picture.
2. Superb, but unsatisfactory. Thin tall figures—awkward action of soldiers. Fine grotesque dwarf and dogs. But figures only about four feet high; a bad size. In this picture is a sunrise with rays and clouds. Total failure. Rays hard edged so [sketch]. Compare with Turner's hard ray in Lucerne.
3. Remarkable for expression of intense humility in Centurion, while his dress, face, and retinue are purposely made splendid in the extreme. Veronese expresses the astonishment of the humiliation better than any one I ever heard speak of the thing.

CORREGGIO.—1. "LA NOTTE."² The infant is lighted from above, the back of its head being brown. But there is no light above to account for this, and the child lights everything else, angel

in the diary Ruskin says, "Note the absolutely green or olive-grey background without the slightest break in my Red Lady. Also, two portraits of Giovanni and Gentile Bellini (by John Bellini?) in Berlin Gallery, quite magnificent and entirely dark in background." These portraits are now ascribed to the school of Bellini, but they do not represent the artist and his brother. There is a similar double portrait in the Louvre (see Vol. XII. p. 453).

No. 2 is "Titian's daughter Lavinia as a Bride" (No. 170): see above, Preface, § 4, p. 6.

No. 3 is "Lavinia as a Married Woman" (No. 171): see above, Preface, § 4, and p. 117. Elsewhere in the diary Ruskin notes, "Richness of mouth very peculiar."

No. 4 is the "Portrait of a Lady in Mourning" (No. 174).

No. 5 is the "Portrait of a Lady with a Vase" (No. 173).]

¹ [Ruskin probably meant by the four (1) "The Cuccina Family" (No. 224): formerly called "His own Family"; for this see above, pp. 290, 336. (2) "Christ bearing His Cross" (No. 227): not now attributed to the master himself; for this see above, p. 294. (3) "The Rape of Europa" (No. 243): also not now attributed to the master himself; for this see above, p. 117. (4) The "Adoration of the Magi" (No. 225), or the "Marriage in Cana" (No. 226), a smaller version of the picture in the Louvre.

For the "Supper at Emmaus" (No. 233), see above, p. 336; the "Finding of Moses" is No. 229; the "Centurion," No. 228.]

² ["The Nativity" (No. 152), commonly called "La Notte."]

and all. The light is *white*. It would be easy to give mystical reasons for this; perhaps Correggio meant it. The Shepherd with lamb on shoulder in his majestic dulness (a man capable of greatness stupefied by shepherd life) is fine. The other figures, intentionally vulgar, fine also, but detestably like Murillo.¹ Yet a mighty picture. The sprawling angel at top is the worst fault in it.

Compare the diagonals of stick in this picture with trunk in *Æsacus* and *Hesperie*.²

2. ST. SEBASTIAN.³ Madonna above has crude yellow light behind her. Straddling angel on cloud. Twisting St. Sebastian on left.
3. ST. JOHN BAPTIST. A dark Madonna against whitish light. Head of (St. Francis?) on left, execrably drawn. Dark St. John Baptist on right.

Vegetation marvellous on left of this picture.

4. ST. GEORGE. Coxcomb angel—ditto St. George — and petite maitresse Madonna. Lemons and oranges above Dragon's head on ground, with streaks of blood running from it, not large, yet at once making one think of an ox head at a butcher's.

The vegetation is almost the only thing left pure and of high value in the Correggios.⁴ It is superb in all—miraculously composed in the *Notte*. Their vulgar graces are very repulsive to me, as much as of old at Parma nearly, but I see the enormous power and lusciousness more.

Correggio's ideal of drapery is very curious. So square and angular and false, and yet so fine. No gravity in it.

Note lemons and oranges painted very thoroughly in the great garland above the picture of the St. George.

VINCENZO CATENA.—Most exquisite saint's head in retouched wreck of picture.⁵

PALMA VECCHIO.—Recumbent Venus: head superb. Two Holy Families most beautiful.

VANDYCK.—*Queen Henrietta*. White, grey, and gold. Ineffably beautiful in conception, though far lower than Titian in mode of work. It is almost exactly half way between Titian and Leslie. The lady-like, drawing-room grace is just on a level with the painting.

A *Madonna* of Vandyck's pretty, but she and the Christ both intensely vulgar.

TITIAN.—*Holy Family with Magdalen*; not satisfactory. Query, an imperfect picture, if so highly interesting.⁶

¹ [For Ruskin on Murillo, see Vol. III. p. 670.]

² [For this drawing by Turner, see the Plate in *Lectures on Landscape*.]

³ ["The Virgin Enthroned, with St. Sebastian and other Saints" (No. 151). "St. John Baptist" is "The Virgin Enthroned, with St. John Baptist, St. Francis, and other Saints" (No. 150); for the "St. George" (No. 159), now attributed to "School of Correggio," see above, p. 118.]

⁴ [See pt. vi. ch. x. § 5 (p. 117).]

⁵ [A "Holy Family" (No. 65).]

⁶ [The attribution to Titian of this picture (which has been much restored) has been doubted, but it is now generally accepted as an early work of the master.]

TITIAN.—*Tribute money*; poor, except in hand. Perhaps over-cleaned.

REMBRANDT.—His wife on his knee, champagne in hand, and peacock in pie on table. The finest Rembrandt I ever saw. Compare the moral of it with Veronese Family: he himself, observe, has his hands in attitude of prayer, and is in the background of all.¹

REMBRANDT'S *Ahasuerus and Esther* is as great a piece of painting as I have seen of his after the Peacock Pie. It is wholly false in chiaroscuro. The light falls brilliantly on the Esther alone, though it enters far on the left at a [sketch]. It is graduated up to her past the dark figures; at first one thinks there must be a torch or light in the dish in centre of table. But no such thing; perhaps Rembrandt first intended it; but assuredly he intended finally to efface it, painting a white sleeve over it. For all the left cheeks of the figures on Esther's right hand are dark. They would have been light had there been a candle in the dish. The garnish of small wall ferns and other herbage in this dish is wonderfully painted for look of fact.

MUNICH²

WOUVERMANS.—Large landscape in Gallery here.³ Note confusion of ideas. It is neither a river nor a lake; much too large for a river, it yet has no reflections nor any other character of wide water—a slate table merely. On it boats; some fishing—a net with corks in bad perspective; others bathing, a man pulling his shirt over his ears; others swimming about. On the left a mixture of villa and ruin—square castellated tower; gardens at the top, some trellis and creepers give a fantastic, unlikely look to the rest. A gentleman coming downstairs here to get into a boat, a servant catches his dog. The foreground is a ragged, dark, comfortless bit of Dutch broken ground, with, however, some graceful trees and a statue on a pedestal. Under which are three musicians, one fluting, two fiddling, and two people dancing—a well-dressed couple—a coach in waiting behind. A beautifully, or at least richly and highly dressed woman on horseback, with a falcon, is the principal figure in picture . . .⁴ and touched up in his usual way, and really graceful. In the centre a fatter woman is riding her horse into the water after a stag and hind, who are galloping as on dry ground in the middle of the water, which is to be presumed a ford. One horseman pursues cautiously, another is thrown headforemost into the river, which is deep at the edges, though shallow in the middle. The dogs swim, some running footmen, and other dogs are coming up, and children are sailing a toy boat in the close foreground. The colour of all is dark and grey to bring out the lights, spotty as usual; the sky cloudy and cold.

¹ [For this picture, see above, p. 331.]

² [For notices of other pictures in the Munich Gallery, see above, Preface, v. 6 (Titian's Admiral) and p. 328 (Rubens' Last Judgment).]

³ [Now No. 496: "A Stag Hunt"; see above, p. 365.]

⁴ [Word indecipherable.]

PAUL POTTER.—Paul Potter's wonderful one: "Une femme à côté de son mari apprend à marcher à un petit enfant." Small cattle piece with sheep, an old woman, stooping, holding a child at play with another.¹ Paul Potter had found out the delight of drawing wrinkles, knots, and clusters of hair, and dwells on these exclusively, loving all high character everywhere for the sake of mere sinuosities. The fleece and bark of tree are, however, in this picture marvellously wrought. He differs from all other Dutch painters in having a true idea of the grass of trees, and in refusing black trickery to set off his light, which is pale and beautifully diffused Cuyp.

De Hooghe, Paul Potter, Teniers, are the chief Dutch painters of any true merit.

[1133.²] TITIAN.—*Jupiter and Antiope*. Very sensual. Flesh has been fine—much injured. Gold and grey. Rich in texture. Two heads only. Would make one think Titian most base in aim, if one was nothing else.

[572.] ZACHTLEVEN.³—Minute, blue, and grey; toy-like view of Rhine. No sense of sublimity or power or freshness, but some of quantity and delicacy and space. Very odd, and to be thought over. Ruins all neat. 574, same kind. 573, same, on Rhine; painted on copper, the others on wood.

[549.] RUYSDAEL.—"Paysage d'Hiver." Black sky, entirely gloomy and desolate, no one beauty or virtue felt; nothing but cold and darkness unconsolated. Commonplace painting, but genuine.

[470.⁴] TERBURG.—A messenger giving a letter to a lady dressed in red. Very fine indeed of its kind. Exquisite ornament and costume drawing in the messenger; rich and *enjoyed* intensely, but not exaggerated.

[437.⁴] A boy cleaning his dog; much broader and grander and really fine.

[546.] RUYSDAEL.—Fine dark landscape with grey swollen brook; not a vestige of colour or reflection in it. Oaks on hill behind.

[830.] *Pieta* of VANDYCK.—Base form of picturesque; miserably false. The body casting a black shadow on white cloth, and no light reflected from the cloth. The whole forced, false, and without one atom of true feeling, but very captivating; the commonplace of sentiment much stronger than it would be in a great man; the Madonna looking up in an agonising appeal to heaven: "Why has this been permitted?" But it is all principle of pyramid. Balance of lights, white scroll on cross, used as a beautiful carving, light, etc. Yet all this might and would be done by Titian or Tintoret, and yet it would be noble because true.

[1304.] MURILLO.—Two beggar boys, one a melon on knee, cut; he has his own slice in hand with two great bites out of it, his cheek stuffed full; his companion has a slice with two smaller bites off the

¹ [No. 472. For remarks suggested by this note, see above, p. 333.]

² [This picture, formerly ascribed to Titian, is now catalogued under Paolo Veronese.]

³ [Herman Zachtleven (or Saftleven), of Rotterdam, 1609-1685.]

⁴ [Now Nos. 388 and 389. For Ruskin's admiration of Terburg's workmanship see above, p. 369.]

end; he hangs a bunch of grapes into his mouth, and is ostentatiously sucking the end of it in. Two flies on the inside of the melon, admirable in their way, and the whole firmly and simply painted, no humbug or slurring; the grapes very fine, the whole of best possible Murillo quality.

[495.¹] PAUL VERONESE.—*Flight into Egypt*. St. Joseph has taken out a clasp-knife to cut something for dinner, the Virgin giving the child suck; his little shirt laid out, sleeves downwards, on a palm-leaf to dry; two angels, swinging at another palm, gathering the dates; and two putting up the donkey in a nice little temporary stall in the shade: one of the angels is, I think, going to rub him down.²

[In some briefer jottings Ruskin notes the portraits by Hans Holbein, the younger, of Derich Born (212) and "Sir Bryan Tuke" (213), and notes of the latter that it gives "the origin of much in the Knight and Death" (of Dürer).

He notices the series of pictures, ascribed to the elder Holbein (Nos. 193–211), as "all of immense interest and finish," at that time "hung out of sight." He marks with special notes of admiration the St. Barbara (210) and the St. Elizabeth (211). These he described in *Ariadne Florentina* (§§ 164, 167, 256); and see also "Sir Joshua and Holbein," § 17.

Among other "abuses in the Gallery" in the matter of hanging, he notices that Titian's "Charles V." and "Grimani" were hung too high.³ Among pictures which he marks for special note are Moroni's "fine portrait" (1124); Veronese's "magnificent portrait" of a Venetian Lady (1135); Titian's portrait of Aretino ("fine," 1111); and a "fine portrait" by Paris Bordone—of a woman in red velvetene (1122). "My little girl" of Vandyck's is also noted; that is, the girl who holds her mother's arm in the portrait of the wife of Colyn de Nole, the sculptor (No. 844). Ruskin made a copy of the girl, which is preserved at Herne Hill.]

¹ [In the old catalogue of the Gallery; the picture is not included in the new catalogue.]

² [Passages in the MS. of pt. ix. ch. vi. ("Rubens and Cuyp"), at the place where Ruskin is discussing the treatment of animals by the old masters (pp. 332 *seq.*), show that he intended at one time to notice this picture there. "Angel and donkey picture" he calls it, and the following description occurs:—

"Two angels are putting up the donkey; other two have set to work to gather dates, and are enjoying it immensely—swinging about in the palm-tree like monkeys, shaking and fluttering and sending down ever so many more than are wanted; one can hear them laughing to each other like school-boys."

³ [Compare *Cestus of Aglaia*, § 4.]
